**HDNRE 597A** Foundation of Environmental Education (3) HDNRE 597A is offered as a component of the still developing Environmental Education option in the Human Dimensions of Natural Resources and the Environment (HDNRE) Dual-Title Graduate Program. This course is designed to allow students to develop a common level of understanding of the history, definition, content, methodologies, and contemporary philosophies of environmental education and resultant environmental literacy. The course has its goals to introduce students to: (1) how environmental education has evolved into its present form with respect to definition and philosophy; and (2) the current content areas and methodologies used in environmental education. HDNRE 595 is comprised of two main components, the first focusing on the cognitive content associated with environmental literacy, and the second focusing on the methodologies employed in developing environmental literacy through environmental education.

HRER 800 International and Comparative Employment Relations (3) This course examines employment relations systems in the world today and the influence of globalization on employment relations practice.

HRER 800 International and Comparative Employment Relations (3)

This course explores contemporary topics in employment relations in the world. It provides an overview of globalization-understood as an increased economic, political, and social inter-connectedness in the world today. The course then examines seven examples of employment relations systems, each carefully chosen to illustrate important variations in employment relations practices. The first course is Germany, which provides an example of a country with strong national unions and a highly developed system of works councils. The Swedish case exemplifies a well-developed system of centralized bargaining and tripartite relations that is now in transition. Both Germany and Sweden are also known for having strong social welfare systems. The third course, Japan, illustrates some of the initial experiences with team work, just-in-time production, and employee commitment through job security and training. The next case, China, offers an example of a socialist system in transition that has become an economic powerhouse through massive export processing zones, government controlled unions, and wage competition. Brazil provides an important example of a Latin American country where the employee relations system is characterized by state dominated corporatism. South Africa offers a case of a system in transition from extreme racial segregation to a democracy in which labor unions are active both in the workplace and in politics. Finally, India represents Asia’s other economic powerhouse, with an English speaking workforce that is drawn to the booming call center industry and export-oriented production. The second half of the course looks at broader themes related to the topic of globalization. Here the three core actors in the employment relations system are examined in their international context. Instead of domestic employers, we study multinational corporations and their diffusion of employment relations practices. Instead of national governments, we study inter-governmental institutions such as the World Trade Organization, and the International Monetary Fund. And instead of national unions, we look at international union organizations such as the Global Union Federations (GUFs) and the newly formed International Trade Union Confederation (ITUC). The three core employment relations actors work together through the International Labour Organization (ILO). The final unit of this section examines the hot topic of Corporate Social Responsibility (CSR), recent attempts by corporations-at times in coordination with labor unions--to establish basic sets of rules or standards for their employees wherever units of the corporation might be located in the world today.

HRER 802 Organizations in the Workplace (3) This course provides students with an overview of selected managerial behavior and career topics in modern organizations.

HRER 802 Organizations in the Workplace (3)

Through the case method, students will be challenged to think critically about real-world problems faced by employees, managers, and organizational leaders. Incorporating basic theoretical principles, we will brainstorm and explore possible approaches to diagnosing these problems and implementing solutions. The approach to learning is purposefully interactive and open-ended, although each module will include some readings summarizing relevant current academic research that provide a framework for thinking about the case. Team exercises and a term paper also provide opportunities for more in-depth exploration of one or more issues introduced during the course of the semester. Students should leave the class with (a) practice in critical thinking; (b) tools for analyzing and managing their own careers in organizations; (c) exposure to some basic concepts from organizational and management science; (d) knowledge about several real-world managers, companies and industries. Evaluation will be based on participation in online case discussions (40%) and written case memos (20%), an individual career and network assignment (20%), and an individual or team option final project involving a paper (10%) and presentation (10%). All letter grades will be assigned in accordance
with the University’s grading policy.

**HRER 816 Labor Market Analysis (3)** Neoclassical economic and institutional theoretical perspectives on labor supply, demand for labor, internal labor markets, wage determination and labor policies.

**HRER 816 Labor Market Analysis (3)**

Virtually everyone will eventually develop an intimate acquaintance with the domain of labor markets--the job market, workplace, labor force and household. This course is intended to help students better analyze general issues surrounding work, the market for labor and the employment relationship. It will reveal the interdependence of the economy, workplace structures, labor organizations, household and family structure and public institutions and policies. It will prepare students to more deeply analyze the determination of earnings and employment, and the influence of organizational and individual behavior, government policies and labor relations. The course will examine the structures and processes that comprise the labor market and the range of theoretical perspectives that can be used to understand its operation. It will rely heavily on applying, and critically appraising, the various perspectives from the field of economics, integrated with other approaches. Its scope will include analyzing the level and types of employee compensation, employment opportunities, labor force participation, work and non-work time, earnings inequality, work-life conflict, etc. It also examines how labor markets, employers and workers are affected by interventions such as government regulatory policy, labor unions, discrimination, and technological advancement. Each unit will focus on an issue within labor markets, and how it may be analyzed in a rigorous way.

- the individual's decision to participate in the labor force and how much time to devote toward paid work as opposed to leisure, studying and family;
- the individual and employer decision to invest in their own "human capital" (employees' skills) via payment of training and higher education;
- the employer's demand for labor resources in both the short-run and long-run and its determinants such as output demand;
- the determination of wages in perfectly competitive or internal labor markets;
- the effect of working conditions, such as hazardous or insecure jobs, on pay;
- the influence of employee compensation schemes on productivity and turnover;
- the effect of labor unions and collective bargaining on levels of pay, productivity, profitability and employment;
- the effect of government subsidies, taxes, minimum wage, maximum hours and family leave regulations on labor supply and demand, worker earnings and well-being;
- the effect of various types of discrimination present in the labor market on gender, race and age earnings differentials;
- the influence of the "new economy" (technology, networking) on unemployment and quality of employment (e.g., temporary jobs, work schedules) and income inequality.

**HRER 825 Strategic Business Tools for HRER Professionals (3)** This course connects Business Strategy, Financial Tools, and HR to an organization's strategic business objectives.

**HRER 825 Strategic Business Tools for HRER Professionals (3)**

Students will learn critical concepts associated with business strategy initiatives, including the application of the experience curve, the growth-share matrix and blue ocean strategies. Students will particularly focus on an analysis that supports the creation of a sustained competitive advantage.
This process will expose students to the basic accounting processes from which the statements are built, personalize the understanding of the purpose and use of each of the statements, and address many of the financial concepts which will help students gain credibility with other organizational decision makers. Also, students will address such issues as calculating Return on Investment (ROI), other cost/benefit tools, as well as the conceptual framework around which risk management issues affect financial calculations.

HR students will develop a comprehensive understanding of tools that link HR policies and practices to the support of business strategy. In this context the critical concept is the use of metrics designed to provide continuous feedback concerning the efficiency and effectiveness of HR efforts. Students will learn how to identify appropriate metrics based on specific initiatives (e.g., talent management), create metrics that are valid and reliable measures of success, and create dashboard (i.e., balanced score cards) designed to provide comprehensive data to all corporate stakeholders.

HRER 836 Diversity in the Workplace (3) This course examines workplace diversity, gender and race challenges facing employers and employees, and the skills for managing diversity.

This course will examine gender and race issues challenging employers and employees in an age when demographic changes and globalization are significantly increasing the diversity of the U.S. workforce. This course will provide an opportunity for students to explore the various ways in which ethnicity, race and gender, sexual orientation, national origin, and disability impact the workplace. Specific issues to be examined include employment and discrimination laws, work and family policies, human resource practices (such as recruitment and selection), and sexual harassment. The course will also explore various workplace accommodations and strategies for managing diversity in the workplace; sex roles; occupational choices made by women and minorities; and career development. This course is one core requirement for the Masters Degree Program in Human Resources and Employment Relations. It provides graduate course level coverage of topics addressed in L I R 536: Labor Diversity in the Workplace. Mastery of course material will be evaluated through both informal and formal assignments which include case studies, exercises and group activities, participating in on-line discussion, and short essay exams.

HRER 897C Ethical Decision Making for HR Professionals (3) Ethical decision making represents the way in which we resolve conflicting moral demands that we face. This course addresses that problem in the context of Human Resource Management professions. The course will identify the normative standards (moral principles) that are most frequently utilized when confronting such dilemmas, as well as a systematic approach to decide the appropriate course of action. The course will also explore recent research on the manner in which stakeholders actually do make such choices. Throughout the course students will study and discuss a variety of cases that typically confront HR professionals at work, using materials from the class to explore alternative solutions. The course will also contain a significant amount of information concerning non-Western moral principles as well as situations involving their application to problems that have emerged in the global business environment in which HR is frequently involved.

**HD FS 416 (US) (SOC 411) Racial and Ethnic Diversity and the American Family (3)** This course will explore the nature and determinants of racial and ethnic variation in family processes in the United States.

**HD FS 416 (SOC 411) Racial and Ethnic Diversity and the American Family (3)**

During the last several decades, the racial and ethnic composition of the U.S. population has changed dramatically. At end of the 20th century, non-Hispanic whites accounted for less than 75 percent of the U.S. population. While blacks remained the largest minority group, there were nearly as many Hispanics as blacks, and the number of Asians was increasing. Population projections indicate that by the middle of the 21st century, Hispanics will make up nearly one-fourth of the U.S. population. Blacks, Asians, and American Indians together will comprise an additional fourth of the population. The last several decades have also brought significant changes in family life in the United States, including declining rates of marriage, a rising age-at-marriage, an increase in cohabitation, and a dramatic rise in the proportion of births outside of marriage. While these trends in family life have been experienced by all racial and ethnic groups, there is substantial variation in family patterns by race and ethnicity. The course will build on other courses in social inequality and the family. The course does not overlap with any existing courses in the Department of Sociology or with courses offered in other relevant departments.

This course will explore the nature and determinants of racial and ethnic variation in family processes in the United States. The student will read articles from major sociological journals and learn to extract major points and issues. He/she will learn to synthesize and critique various arguments on major issues in the field. The student will acquire skills in summarizing and evaluating arguments in essay form. He/she will also develop oral presentation skills. Final grades for the course will be based on class participation, a brief (approximately 5 pages) paper, a group presentation, a midterm examination (essay format) and a final examination (essay format). The course is not required for the Sociology minor or major. However, the course can count as one of the 400-level elective courses in Sociology for the Sociology minor, B.A. or B.S.

HD FS 427 (KINES 427) Developmental Sport & Exercise Psychology (3) Developmental changes in the antecedents and consequences of physical activity across the lifespan.

Developmental Sport & Exercise Psychology (3)

Change is constant with physical activity - our reasons for being active change across the lifespan and our experiences with physical activity change how we view ourselves and those around us. Developmental Sport & Exercise Psychology focuses on developmental changes in the psychosocial antecedents and consequences of physical activity across the lifespan. Specific course objectives include (1) describing theoretical frameworks and methods used to study physical activity-related psychosocial development across the lifespan, (2) describing how self-perceptions develop and influence behavior in movement contexts at different points in life, (3) explaining how contextual factors influence developmental processes associated with physical activity, (4) identifying age-related differences in activity-related antecedents and consequences of physical activity, and (5) developing, reviewing, and critiquing theoretically-grounded interventions to address issues related to developmental processes associated with physical activity across the lifespan. Evaluation will be based on written examinations, submission of a series of reflection papers on reading assignments, a group presentation, and the students' engagement in the class. It extends but does not duplicate existing courses in the Department of Innersole, Human Development & Family Studies, and Psychology.

HD FS 434 (SOC 435) Perspectives on Aging (3) An analysis of the demographic, social, and cultural factors affecting the aged population in American society.

HD FS (SOC) 440 Family Policy (3) An in-depth examination of family policy.

This course meets the Bachelor of Arts degree requirements.

This course is designed to provide an in-depth examination of family policy. Students will identify and critically analyze major issues, controversies, and policies that affect families. Attention will be devoted to recognizing both intended and unintended consequences of family policies and understanding policy challenges and trade-offs. Students will gain an understanding of how policies are shaped by both facts and myths, as well as our values. Students will examine historical and current trends in family patterns (e.g., divorce, women’s labor force participation, nonmarital births) to understand the implications they hold for individuals, families, and society. Students will gain an awareness of the social, economic, historical, legal, and political contexts within which family policies exist and are proposed. Although the main focus is on U.S. family policy, some time will be devoted to learning about family policies in other countries. We will learn about several specific family policies in depth (e.g., welfare), but a final goal is to help students develop a general way of looking at family policy that they can then use to understand any issue of family policy that unfolds throughout their lifetime. This course will foster thoughtful reflection and critical thinking, writing skills, research skills, and skills of synthesis, logic, and argument. Course goals will be accomplished through course readings, writing assignments, lectures, class discussions, debates, and group projects. Mastery of course material and student evaluation are assessed in several ways. Students will take a midterm and final exam that cover lectures, class discussions, and assigned readings. Two papers are also required. The first paper is based on an analysis of newspaper articles dealing with family policy issues that students will collect and relate to course materials. The second paper is a literature-based analysis of a family policy in a society outside the United States. Class participation is also essential and its evaluation will be based on a combination of class attendance, contributions to class discussions, participation in group debates and projects, and an oral presentation of the final paper on a non-U.S. family policy.

**HD FS 495A Internship: Advanced Experience (9)** Full-time, one semester experiential training in human service settings. Open to HD FS majors only.

HD FS 495A represents a full-time, one-semester internship experience. Its focus is experiential learning accompanied by intensive supervision, provided by one-site personnel, as well as University-based mentoring. Taken within a year of the pre-internship course (HD FS 490), which helps the student with the details of making arrangements for their internship, HD FS 495A, taken during the same semester as HD FS 495B, is considered the capstone of the HD FS undergraduate program. The internship can be taken during the fall, spring, or summer semester. It is one full semester spent working as a human service professional in a setting of your choice. Generally interns will work as a full-time professional (35-40 hours a week) for the semester.

**HD FS 495B Internship: Advanced Project (3)** Implementation of internship projects or scholarly paper. Open to HD FS majors only.

HD FS 495B is taken at the same time as HD FS 495A, and within a year of the pre-internship course (HD FS 490), which helps you with the details of making arrangements for the HD FS internship, HD FS 495B focuses on the academic aspects of the internship experience. This course can be taken during the fall, spring, or summer semester. Currently, HD FS 495B consists of writing three papers: The Organizational Analysis, The Policy Analysis, and The Personal Development Paper. The purpose of the organizational analysis paper is to give the intern an opportunity to learn about his or her internship setting or organization in greater depth than might be possible otherwise. This will necessitate the intern taking an active approach to systematically securing information about the internship organization through the review of relevant documents, conducting formal or informal interviews, and observation. This paper will then be saved at the internship office, without identifying information or grade, to be viewed as a source of information about potential internship sites by future students who are seeking internships.

**HD FS 497A Autism - Providing Professional Support for Individual and Families (3)** This course will emphasize professional development for students planning to pursue careers in the field of autism. Topics include the stresses and needs of families and siblings of children with Autism Spectrum Disorders (ASD), vocational and social challenges faced as individuals with ASD age into adolescence and adulthood, and techniques to aid parents in becoming effective advocates for their child's academic, social, and behavioral needs. Although the core symptomatology of ASD and empirically validated interventions will be covered as foundational knowledge, these topics will not be the focus of this course. Rather, this course will identify the challenges and strengths likely to be encountered in the lives of families and individuals with ASD and provide current best practices used to help clients navigate life with ASD.

HD FS 530 Longitudinal Structural Equation Modeling (3) Exposure to a wide variety of statistical models as special cases of the General Linear Mixed Model with latent variables.

HD FS 530 Longitudinal Structural Equation Modeling (3)
This course provides a broad overview of structural equations modeling as a method for studying developmental processes in Human Development and Family Studies. In this course, students gain a thorough hands-on understanding of a wide variety of statistical model types as special cases of the General Linear Mixed Model (GLMM) with latent variables. Specific statistical model types covered include: exploratory and confirmatory factor analysis; linear, nonlinear and multivariate latent growth curve modeling; quasi-simplex modeling; longitudinal factor modeling; multi-group factor analysis, including a concise introduction to behavior genetic modeling; mediation analysis; testing for measurement equivalence; MANCOVA with nonstandard within-subject covariance structures; outlines of statistical selection theory and principal component analysis. The presentation of these diverse model types as special instances of the same GLMM is helpful to understanding their relationships and differences and considerably streamlines applied statistical modeling. Each of these statistical model types are commonly used to analyze data from studies in the field of Human Development and Family Studies and illustrative examples are provided.

Each model type is explained at 4 levels: 1) in terms of a set of simultaneous model equations; 2) as a set of matrix equations; 3) as a graphical model; and 4) as a Lisrel input code. All model assumptions are made explicit and the interrelationships between the 4 levels of model representation are emphasized. Then the model is applied to simulated and real data. The obtained model fits are assessed in terms of various statistical criteria and conclusions are explicitly drawn based on standard statistical decision theory. Selected models from studies of Human Development and other social sciences are interpreted in terms of content and possible pitfalls in their interpretation are discussed. For each modeling technique appropriate background publications, lecture notes and advanced reading material on nonstandard topics are provided.

**HD FS 537 (SOC 537) Biosocial Perspectives on the Family (3)** The implications of knowledge from behavioral endocrinology, behavior genetics, and evolutionary psychology for understanding family relationships and child development.

**HD FS 537 (SOC 537) Biosocial Perspectives on the Family (3)**

Breakthroughs in the way biological variables are measured and modeled have generated new findings that greatly increase our understanding of the reciprocal influences between family relationships, child development, and biological factors. Specifically, advances in the study of hormones, genetics, evolution, pharmacology, and immunology have led to important advances in our knowledge of gender, becoming a parent, early child development, middle child, and adolescent development, parent-child relations, courtship and mate selection, quality of intimate relations, separation and divorce, incest, and dominance and family violence.

Students are required to keep a journal of researchable ideas during the first five weeks of class. The purpose is to give students practice in identifying research needs and opportunities. The journal should include 4-6 research problems, each developed in 2-3 typed pages. The majority of each entry should be a clear statement of what knowledge gains would be realized by conducting the study and why they are important. The remainder of the statement should include consideration of the data you would use, measures of major variables, and analytic strategies. Think of it as a brief portfolio of thesis, dissertation, or research publication ideas.

Entries on research projects in which you are already involved are not eligible for inclusion in the journal. On the last page of the journal, indicate which problem you would like to develop into a more detailed proposal during the remainder of the semester and why. Turn in the journal during week 5. I will evaluate your entries and comment on your selection idea. The rest of the semester will be spent on developing one of the ideas to a full-blown proposal (about 20 pages). You should turn in as many drafts as needed to receive a good grade for this segment of the course. I expect you to turn in three or more before the end of the semester. We will meet about each draft and go over my comments. Proposal drafts should be spaced out over the semester.

The last week of the semester will be devoted to presentations of research proposals after which class members will offer comments and suggestions. Your grade will be based on the proposal draft you turn in the last week of the class. Twenty-one percent of the course grade is based on the research proposal.

The Pennsylvania State University
HD FS 540 Parenting: Theory, Research and Intervention (3)  Review of current theory, research, and intervention in the study of parenting.

This course is designed to have students think critically about parenting and parenting competence by reviewing theoretical, ideological, and empirical literature. Competent parenting is a key factor in producing desirable child outcomes. Therefore, in this course, parenting competence reflects the behaviors and practices parents use that contribute to the child’s ability to function in society. In particular, the course will examine how parenting behaviors, such as warmth/responsiveness, and forms of discipline promote desired child outcomes in attachment relationships, conscience development, internalization of values, and other socio-emotional outcomes.

Effective: Spring 2014
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

HD FS 544 Seminar in Dysfunctional Patterns in Family Organization (1-6)  Processes of familial dysfunction and disorganization and their explanation in economic, social-psychological, and managerial terms.

Seminar in Dysfunctional Patterns in Family Organization (1-6)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

HD FS 545 Families and Socioeconomic Systems (1-6)  Functional interrelationships between families and social and economic systems.

Families and Socioeconomic Systems (1-6)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

HD FS 546 Seminar in Family Relationships (1-9)  Interpersonal interaction within family systems throughout the life cycle.

Seminar in Family Relationships (1-9)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

HD FS 549 (PSY 549) Developmental Theory (3)  Conceptual frameworks and major contributions to the study of individual development across the life-span.

Developmental Theory (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 565** Developmental Behavioral Genetics (3) Theories and methods of developmental behavioral genetics and their application to human life-span development.

**Developmental Behavioral Genetics (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1990

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 569** Seminar on Development in Middle Age (1-6) Interdisciplinary approach to study of human development in middle age, including psychological, cultural, and biological aspects.

**Seminar on Development in Middle Age (1-6)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 577** Poverty, Policies, and Child Development (3) Focuses on interrelationships among families, poverty, and social policies.

**Poverty, Policies, and Child Development (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 579** Seminar in Adult Development and Aging (1-9) A seminar dealing with specific topics concerning adult development and aging.

**Seminar in Adult Development and Aging (1-9)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 590** Colloquium (1-3) Continuing seminars which consist of a series of individual lectures by faculty, students, or outside speakers.

**Colloquium (1-3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 595** Field Projects in Individual and Family Studies (1-9) Supervised research or internship in human services program.

**Field Projects in Individual and Family Studies (1-9)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 596** Individual Studies (1-9) Creative projects, including nonthesis research, which are supervised on an individual basis and which fall outside the scope of formal courses.

**Individual Studies (1-9)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 596A** Graduate Student Orientation (1) This is a continuation of orientation meetings for our first year graduate students.

**Graduate Student Orientation (1)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597** Special Topics (1-9) Formal courses given on a topical or special interest subject which may be offered infrequently; several different topics may be taught in one year or term.

**Special Topics (1-9)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1990

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597A** An Introduction to Latent Class and Latent Profile Analysis (1) The goal of this short course is to help students gain the background and skills to be able to address interesting research questions using latent class and latent profile analysis. Latent class theory is conceptually similar to factor analysis. However, in latent class theory, latent variables are categorical, and individuals are sorted into mutually exclusive and exhaustive latent class based on a set of item responses. Latent class analysis uses categorical indicators to identify underlying subgroups in data and estimate their prevalences, while simultaneously adjusting for measurement error; latent profile analysis is conceptually similar but uses continuous indicators. These models can be extended in a variety of ways; for example, multiple-groups analyses can be performed, covariates can be introduced to predict latent class membership, and latent class membership can be used to predict later outcomes.

**An Introduction to Latent Class and Latent Profile Analysis (1)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597B** The Bio-Psycho-Social-Societal Consequences of Child Maltreatment (3) The purpose of this course is to review the breadth of literature on the bio-psycho-social-societal impact of child maltreatment including sexual abuse, physical abuse and neglect. Students will adopt a portion of the literature that is in line with their respective area of research and work to integrate child maltreatment studies into a relevant, cohesive framework for understanding sequelae as broadly applied.

**The Bio-Psycho-Social-Societal Consequences of Child Maltreatment (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597C** Gene-Environment Transactions in Childhood and Adolescence: Theory and Findings (3)

Environments and genes work together to make us who we are. Some research emphasizes the relative contribution of these two factors. Other research focuses on environments only, hoping that genetic influences don’t exist. Neither of these approaches captures how genes and environments combine to contribute to positive and negative developmental outcomes. Fortunately, with advances in genotyping technologies and reduced costs, the last decade has seen a huge increase in research that considers the co-active nature of environmental and genetic influences. This course will review perspectives from life history, developmental systems, and behavioral genetic traditions that address how genes and environments work together to contribute to development. Empirical articles will be drawn from sociology, psychology, and other disciplines.

**Gene-Environment Transactions in Childhood and Adolescence: Theory and Findings (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597D** fMRI Data Analysis (3)

The purpose of this course is to build up a thorough understanding of statistical models used in connectivity mapping of multivariate fMRI time series. To independently apply these models to real data, using selected platforms. Special emphasis is given to testing important assumptions underlying connectivity mapping (in particular homogeneity of replications and stationarity) and ways to deal with violations of these assumptions.

**fMRI Data Analysis (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597E** Person Specific and EMA Data Analysis (3)

The purpose is a) To build up a thorough understanding of factor analytic and dynamic systems modeling of multivariate psychological time series obtained with single and multiple subjects, including time series obtained in Ecological Momentary Assessment; b) To learn to independently implement any of these models in commercial structural equation modeling software as well as the special-purpose program MKFM6; c) To learn to apply these models to diverse data sets and correctly interpret the obtained results.

**Person Specific and EMA Data Analysis (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Ending: Fall 2014 Future: Fall 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**HD FS 597F** Person-Centered Methods: Advanced Contingency Table Analysis (1)

This course takes an easy-to-understand look at a statistical approach called the person-centered method. Instead of analyzing means, variances, and covariances of scale scores as in the common variable-centered approach, the person-centered approach uses contingency tables to examine persons or objects grouped according to their characteristic patterns or configurations. In contingency tables, the observed patterns are ordered by their indices; a certain position in a table, denoted by a pattern or configuration, is called a cell. The main focus of the course will be on configural frequency analysis (CFA; Stemmler, in press; von Eye, 2002), which is a statistical method that looks for over- and under-frequented cells or patterns. A pattern or configuration that contains more observed cases than expected is called a type; a pattern or configuration that is observed less frequently than expected is called an antitype.

**Person-Centered Methods: Advanced Contingency Table Analysis (1)**

Bachelor of Arts: None
Effective: Fall 2014 Future: Fall 2014
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Ihc - Refugee Law (IHREF)

IHREF 995A In-House Clinic - Refugee Law Clinic (3) Representation of foreign nationals seeking political asylum or related forms of relief in US Courts.

In-House Clinic - Refugee Law Clinic (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Ihc-Art,Sprt,Ent Law (IHASE)

IHASE 995A In-House Clinic--Art, Sports, and Entertainment Law (1-2 per semester/maximum of 4) This clinic is designed to acquaint students with the unique yet pragmatic knowledge and skills incident to rendering quality legal service in the art, sports, and entertainment professions.

In-House Clinic--Art, Sports, and Entertainment Law (1-2 per semester/maximum of 4)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2011
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Ihc-Children'S Advoc (IHCAD)

IHCAD 995A In-House Clinic-Children's Advocacy (4 per semester/maximum of 8) The course will provide instruction to students in the legal representation of children in various civil matters, including dependency, adoption and custody actions. Students will be managing a caseload of clients. Students will meet directly with their clients, and corespond with agencies and opposing counsel. Students will appear at all court appearances with a supervising attorney. The supervising attorney will meet with students individually on a regular basis for case reviews. The classroom component of the course will focus on various substantive and skills issues, including lectures on child interviewing skills and lectures from physicians on the medical aspects of child abuse, etc.

In-House Clinic-Children's Advocacy (4 per semester/maximum of 8)
Ihc-Disability Law (IHDIS)

IHDIS 995A In-House Clinic--Disability Law (4 per semester/maximum of 8) Up to four students per semester represent indigent persons with disabilities who have legal concerns related to those disabilities. The bulk of the work consists of administrative hearings before the Social Security Administration and judicial review in federal court. Matters handled include Social Security and Supplemental Security Income, special education, disability discrimination, and Medicare and Medicaid claims. Students are obligated to work 12 hours per week in the Clinic, and there are weekly meetings with the supervisor, either individually or as a group. This course is graded.

In-House Clinic--Disability Law (4 per semester/maximum of 8)

Ihc-Family Law (IHFAM)

IHFAM 995A In-House Clinic--Family Law (4 per semester/maximum of 8) In this clinic, up to twelve students per semester represent indigent clients, primarily before the Court of Common Pleas of Cumberland County, in domestic matters. Cases include divorce, child support, spousal support, custody and visitation, dependency (neglect), domestic violence, and related matters. Students are required to work 16 hours a week at the Clinic, and there are weekly clinic meetings, either as a group or individually with supervisors.

In-House Clinic--Family Law (4 per semester/maximum of 8)

IHFAM 995B Family Law Clinic (5 per semester/maximum of 10) In this clinic, up to seven students per semester represent indigent clients and domestic abuse victims in family law cases. All cases are in the Court of Common Pleas of Centre County. The work includes divorce, child support, spousal support, custody/visitation, domestic violence, and related matters. Students should expect to work as much time as is necessary to represent their clients successfully, which will be an average of twenty hours per week. Students also participate in a weekly clinic seminar which includes skills training, theoretical examination of clinical work, and case rounds. Each student also meets individually with the clinic supervisor to discuss their case work and their progress in the clinic. Only third-year law students are admitted in the Fall Semester. Students earn 5 graded credits.

Family Law Clinic (5 per semester/maximum of 10)

General Education: None

Industrial Engineering (I E)

I E 402 Advanced Engineering Economy (3) Concepts and techniques of analyses useful in evaluating engineering projects under deterministic and uncertain conditions.

Advanced Engineering Economy (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1995
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I E 405 Deterministic Models in Operations Research (3) Deterministic models in operation research including linear programming, flows in networks, project management, transportation and assignment models and integer programming.

I E 405 Deterministic Models in Operations Research (3)

This course will be an introduction to deterministic modeling. In particular, the student will learn to formulate linear programs, network models, and integer programs. The student will also learn solution strategies such as the simplex method and branch and bound. Duality and sensitivity analysis will be covered along with their economic interpretation. Optimization software will be used for solving the formulations. Practical examples along with a detailed case study will be presented to help the student to synthesize the topic. This will be a required course for all undergraduate students pursuing a baccalaureate degree in Industrial Engineering.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I E 408 Cognitive Work Design (3) Design and evaluation of cognitive work, including the human/computer interface, visual displays, software design, and automated system monitoring, with emphasis on human performance.

I E 408 Cognitive Work Design (3)

Cognitive Work Design is a senior level course offered in the Department of Industrial and Manufacturing Engineering. It is one of two courses which follow I E 327, Introduction to Work Design. This course focuses on the cognitive part of human factors and work design. It will be offered in fall and spring semesters. This course will enable students to design, implement, and evaluate human-computer interfaces according to principles outlined in foundational human-computer interaction readings. Students will be engaged in the active learning of design, programming, and usability concepts by way of building interfaces on the personal computer.

Students taking this course should be familiar with computer programming and introduction to work design.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2006
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I E 418 Human/Computer Interface Design (3) Design and evaluation of the human/computer interface, including human performance, visual displays, software design, and automated system monitoring.

The Pennsylvania State University
I E 418 Human/Computer Interface Design (3)

The objective of this course is to enable students to design, implement, and evaluate human-computer interfaces according to principles outlined in foundational human-computer interaction readings. Students will be engaged in the active learning of design, programming, and usability concepts by way of building interfaces on the personal computer as well as on the Palm computing platform. A major component of the course is the capstone design project for which student teams will communicate with users to design, implement, and assess interfaces to improve existing work processes in an actual work domain (e.g., safety office, power plant).

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2014
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I E 419 Work Design - Productivity and Safety (3)

Methods improvement, physical work design, productivity, work measurement; principles and practice of safety.

I E 419 Work Design - Productivity and Safety (3)

Work Design - Productivity and Safety is a senior level course offered in the Department of Industrial and Manufacturing Engineering. It is one of two courses which follow I E 327, Introduction to Work Design. This course focuses on the methods improvement physical work design, productivity, work measurement; principles and practice of safety. It will be offered in fall and spring semesters. This course will enable students to perform work measurement: develop an MTM analysis, and carry out a work sampling study.

Students taking this course are expected to understand basic concepts of work design.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I E 425 Stochastic Models in Operations Research (3)

Stochastic models in operations research with real world applications including dynamic programming, Markov chains, queueing models and inventory models.

I E 425 Stochastic Models in Operations Research (3)

This course will be an introduction to the modeling of stochastic systems. The student will learn about Poisson processes, Markov Chains, Dynamic Programming, and Queueing systems; both model formulations and solutions strategies. The students will learn several applications of these models in manufacturing and service systems, so that they can synthesize the lecture material. The student will study the topic of inventory theory, including fundamental tradeoffs, EOQ modeling, and stochastic models. Grading will be based on exams and homework. This will be a required course for all undergraduate students pursuing a baccalaureate degree in Industrial Engineering.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2014
Prerequisite: Concurrent: I E 405

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**I E 428 Metal Casting (3)** Application of engineering principles to the design of castings; casting of ferrous and nonferrous alloys; laboratory and simulation projects.

**General Education:** None  
**Diversity:** None  
**Bachelor of Arts:** None  
**Effective:** Summer 1995  
**Prerequisite:**  

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**I E 433 Regression Analysis and Design of Experiments (3)** Theory and Application of Regression Analysis and Design of Experiments to build models and optimize process and product parameters.

**Regression Analysis and Design of Experiments** is an elective course for the baccalaureate students in the Department of Industrial and Manufacturing Engineering. It will be offered in the spring semester. It exposes students to the two important statistical tools which are regression analysis and design of experiments. The specific topics include simple and multiple regression analysis, 2k full and fractional designs and analysis and Taguchi's orthogonal arrays.

Students taking this course should be familiar with the following topics taught in the second course in probability and statistics offered in the department.

Properties of point estimators, sampling distributions, testing of hypotheses, and introduction to linear regression and design of experiments.

**General Education:** None  
**Diversity:** None  
**Bachelor of Arts:** None  
**Effective:** Summer 2005  
**Prerequisite:**  

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**I E 434 Statistical Quality Control (3)** Statistical techniques for univariate and multivariate monitoring of independent and autocorrelated processes; foundations of quality control and improvement.

**Statistical Quality Control** is a structured, quantitative approach to improving the quality and cost of products and processes. It provides a framework for quality improvement that builds upon statistical tools to achieve business results. Although statistical techniques are emphasized throughout, the course has a strong engineering and management orientation that will prepare students for synthesizing the material that comprises the Six Sigma body of knowledge. Important aspects of the Six Sigma approach include a strong focus on the customer, proactive management, fact-based decision-making, and
The course objectives are: (1) to give students a fundamental understanding of and experience with solving a problem using the structured problem-solving approach of Define-Measure-Analyze-Improve-Control (DMAIC); (2) to provide an opportunity for students to solve or be involved with solving business problems with statistical tools; and (3) to help students build confidence in their business sense and statistical skills.

**I E 453 Simulation Modeling for Decision Support (3)** Introduction of concepts of simulation modeling and analysis, with application to manufacturing and production systems.

**Simulation Modeling for Decision Support** is a senior level course offered in the Department of Industrial and Manufacturing Engineering. It is the third course in operations research offered to the undergraduate students. The objective of this course is for students to learn to appropriately apply discrete event simulation modeling for decision support in IE problems through developing skills in model building, simulation output analysis, and communication of technical information and conclusions drawn from data analysis.

Students taking this course should be familiar with computer programming and operations research techniques.

**General Education:** None

**I E (M E) 456 Industrial Robot Applications (3)** Introduction to robotics, with emphasis on robot selection, programming, and economic justification for manufacturing applications.

**Industrial Robot Applications (3)**  
This course is a technical elective, and is normally taken by students in their Senior years. In this course, students learn about present and future status of robot applications, and are required to apply fundamental knowledge of physics and mathematics to develop software to analyze and control robots.

The course deals with mechanics and control of robot manipulators and wheeled mobile robots. First, students are taught to analyze 3-D kinematics, statics and dynamics of robot manipulators. Then, control algorithms for robot manipulators are presented. Sensors, actuators and softwares used in industrial robots are discussed. In the end, kinematics and control of wheeled mobile robots are presented. During this course, application of computer, particularly Matlab, is emphasized as much as possible.

**I E 460 Service Systems Engineering (3)** Use of quantitative models and methods for analysis, design and control of service systems.

**Service Systems Engineering (3)**
I E 460 Service Systems Engineering (3)

This course focuses on using operations research methods such as mathematical programming, network analysis and applied probability to solve problems that arise in service systems. The lecture topics will include measuring service quality, methods for evaluating service systems, financial engineering & portfolio optimization, supply chain design & operations, manpower planning & scheduling, and revenue management. Several case studies will be used to illustrate applications. Course grades are based on homework, case studies, mini-project, midterm and final exams.

General Education: None
Diversity: None

Computer Aided Design and Manufacturing (3)

The objective of this course is to teach the students the fundamentals underlying computer aided design (CAD) and computer aided manufacturing (CAM). The students will learn the drawing elements for CAD, including the coordinate systems, the fundamentals of 3 D modeling techniques and basics such as wireframe models, surface and solid models and parametric modeling. The course will include application of CAM techniques to CNC machines, which consists of programming basics, machine setup and tooling systems. The data issues such as representation formats, data exchange and translation for integration of CAD/CAM will also be addressed.

**IE 467 Facility Layout and Material Handling (3)**
Analytical, simulation, and computer-aided graphical methods to generate effective layout designs; design and integration of material handling systems and equipment. For Industrial Engineering majors.

**IE 467 Facility Layout and Material Handling (3)**

Students taking this course will learn concepts and methods used to design an effective facility layout and material handling system. Topics include determination of requirements for people, equipment, and space; generation of alternative layouts based on analysis of material flow or qualitative activity relationships; development of concepts for material transport and storage, and evaluation of alternatives using models. Grading is based on homework and exams.

Prerequisites for the course are IE 302 which covers methods for analyzing the economic feasibility of technical alternatives, and IE 327 which covers job analysis and physical considerations in design of work. The course is an elective for Industrial Engineering students in the manufacturing systems engineering and engineering service systems specialization tracks.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2007
Prerequisite:

**IE 468 Optimization Modeling and Methods (3)**
Mathematical modeling of linear, integer, and nonlinear programming problems and computational methods for solving these classes of problems.

**IE 468 Optimization Modeling and Methods (3)**

This course provides an analytic treatment of optimization models in linear, integer, and nonlinear programming. In particular, the course is concerned with the development of mathematical optimization models and computational solution techniques for solving these problems. The mathematical modeling of real-world applications is complemented with the use of modeling software such as LINGO or GAMS (General Algebraic Modeling System), which allows the user to readily develop large-scale mathematical models. The course also considers solution techniques for solving these optimization problems. Students will develop a basic understanding of the solution techniques through actual implementation of simple algorithms, as well as the use of commercial software such as those provided by LINDO, LINGO, and GAMS.

Prerequisite:

**IE 469 Global Industrial Engineering Experience (1)**

Students will learn how to prepare for a short term, professional exchange in a foreign nation. Students will then travel to a designated university within a foreign nation for the purpose of a five day cultural and professional exchange.

**IE 469 Global Industrial Engineering Experience (1)**

This course will teach industrial engineering students how to prepare for a short term, professional exchange in a foreign nation and how Industrial & Manufacturing Engineering education and practice is carried out in a foreign nation. Students will be required to research and report on one or more industries in a designated foreign nation. Their report will focus on the products and/or services produced by these industries, the processes employed, known use of industrial and manufacturing engineers and/or practice, and their domestic and global standing.

Students will travel to a designated university within that nation for the purpose of a one week cultural exchange. The designated university will have an Industrial Engineering, Production Engineering, and/or Manufacturing Engineering program. Information about the international destination and the dates of travel will be provided on the course syllabus each semester.

During this period, students will:
1. Tour the department and engineering laboratories to learn about the education and research facilities at their host university.
2. Attend engineering classes within the host university to learn about the engineering topic matter as well as how foreign engineering classes are conducted.
3. Give and receive engineering presentations with their host university students.
4. Tour the local community to learn about their culture.
5. Tour local manufacturing industries and interact with local Industrial/Manufacturing engineers to learn about the companies as well as how industrial & manufacturing engineering is specifically practiced.

The Pennsylvania State University
I E 470 Manufacturing System Design and Analysis (3) Contemporary design and analysis methodologies used to organize systems for economic manufacture of products.

Manufacturing System Design and Analysis is a senior level course in manufacturing, required for all the baccalaureate students in the Department of Industrial and Manufacturing Engineering. Students will be exposed to the contemporary techniques used to design and analyze manufacturing systems for economic manufacture of products. Students will learn to design manufacturing systems (human and automated) to satisfy differing types of product demand.

Students taking this course should be familiar with introduction to manufacturing and product specifications and introduction to manufacturing process design and analysis.

Objective of this course is to gain physical insight and hands-on experience with modern control engineering. Lectures and laboratory topics will include modeling and simulation of digital control systems, control computers, interfacing, analog-to-digital converters, digital-to-analog converters, programmable logic controllers, sensors and actuators. Lectures will be devoted to case studies in instrumentation for computer control of manufacturing machines and processes. Course includes a significant group project in which students will design and construct a computer controlled machine or process. This course is a senior undergraduate level technical elective course in the manufacturing system engineering track in the Industrial & Manufacturing Engineering Department. This course is also allowed for graduate credit in the Industrial & Manufacturing Engineering Department.

I E 478 Retail Services Engineering (3) Introduction to retail services operations, process models, and application of information technologies to enhance productivity and profitability.

Objective of this course is to understand modern retail industry with focus on their operations and information technologies that are used in such systems. The course starts with an overview of the basics of types of retailing, their channels, and economics of their operations. Much of the emphasis in the course is on processes and information technologies used in retail industry such as point of sale systems, barcode, RFID/EPC, global data synchronization, EDI, XML, data warehouse, analytics for decision support and supply chain management. Several case studies will be used to draw out the application of tools and techniques covered in the course. Course includes a group project focused on retail industry. Specific topics will include:

- Global retail industry
- Multi-channel retailing
- Performance and metrics
- Pricing
- Layout and workforce
- Information Systems and SCM
- Barcode and RFID
- Data warehouse and analytics
- Case studies

IE 479 (EDSGN 479) Human Centered Product Design and Innovation (3) Consumer product design for a global market, incorporating human factors principles and user desires in a multicultural perspective.

IE (EDSGN) 479 Human Centered Product Design and Innovation (3)

This course will focus on consumer product design for a global market, incorporating human factors and ergonomics principles as well as user needs and emotional desires. The students will be led through product design process, various product design strategies, product planning, managing the development process, product evaluation, decision making tools, and market entry. Special emphasis will placed on user centered design, incorporating user characteristics, user needs and emotional desires (including Kansei engineering approaches), survey methodology, and usability testing. To emphasize the multicultural perspectives in today’s global product design, interdisciplinary teams from two universities on opposites of the globe will apply these principles on actual industrial product designs for leading consumer product manufacturers.

IE 480W Capstone Design Project (3) Industry-based senior capstone design project emphasizing manufacturing systems, service systems, and information systems in an interdisciplinary setting.

IE 480W Capstone Design Project (3)

Students will develop "real world" engineering project experience through an industry-based project. Projects will focus on manufacturing systems, service systems, and/or information systems. Students will work in teams to complete the projects, where the teams will be interdisciplinary and composed of students from within the major with different areas of expertise and students from other majors as needed. Students interested in taking this course should have senior standing and be familiar with basic principles in manufacturing, operations research, and human factors engineering. Students will be evaluated through in-class participation, and a group project that consists of weekly communication with the project sponsor along with three design reviews, interim written reports and a final report, presentation and poster.

This is a Writing-Intensive course in the department and hence students will be given opportunities to practice writing throughout the semester in multiple writing assignments.

**I E 516 (SC&IS 516)** Applied Stochastic Processes (3) Study of stochastic processes and their applications to engineering and supply chain and information systems.

**I E (SC&IS) 516 Applied Stochastic Processes (3)**

This course covers the mathematical fundamentals and tools for analyzing stochastic systems evolving over time, including concepts and techniques related to Poisson Processes, renewal processes, and discrete and continuous time Markov chains. Students will also learn to build probabilistic intuition and insights when thinking about random processes. Additionally, students will learn to apply the essential techniques of stochastic processes to real world problems in the supply chain and information systems area.

This is a prescribed research foundation course for Ph.D. students in SC&IS. Student evaluations are based on class participation, individual and group assignments, and exams. This course will be offered during Spring semester to approximately 5-10 students.

**I E 519 (SC&IS 519) Dynamic Programming (3)** Theory and application of dynamic programming; Markov decision processes with emphasis on applications in engineering systems, supply chain and information systems.

**I E (SC&IS) 519 Dynamic Programming (3)**

This course presents the basic theory and applications of dynamic programming. The focus of the course will be on the theory of Markov decision processes (MDP), which provides an analytical tool to optimally control the behavior of a Markov Chain. The students will learn fundamental MDP models, computational methods and applications in supply chain and information systems, including production and inventory control, quality control, logistics, scheduling, queueing network, and economic problems.

Student evaluations are based on class participation, individual and group assignments, and projects. This course will be offered during Spring semester for approximately 5-10 students.

I E 530 Financial Engineering (3) Financial option pricing and portfolio design relevant to investment decision making.

I E 530 Financial Engineering (3)
The objective of this course is to provide students with the basic terminology, concepts, and issues relevant to financial engineering. It serves as an introduction to the investment, financial instruments, and valuation of projects via portfolio theory and option pricing and is primarily for students who have had exposure to multi-variable calculus and probability theory. Students will learn the core concepts and advanced techniques for decision making of capital investment and for managing and valuing risky projects. This course also aims to enable students to effectively use tools in finance and mathematics in order to conduct rigorous research on topics involving the analysis of managing and valuing flexibility and uncertainty. A requisite course in applied stochastic processes will provide the necessary background on probability models needed for this course.

I E (M E) 546 Designing Product Families (3) Product families, product platforms, mass customization, product variety, modularity, commonality, robust design, product architectures.

I E (M E) 546 Designing Products Families (3)
Designing Product Families is a graduate-level course generally offered in the spring. It is designed for students interested in product realization, engineering design, and manufacturing to gain an understanding of mass customization and methods for designing families of products based on modular and scalable product platforms. The transition from craft production to mass production to mass customization will be covered in this course along with methods and tools for designing robust, modular, and scalable product platforms. Platform leveraging strategies and commonality metrics will be investigated through product dissection activities, which will also be integrated with lectures on evaluating manufacturing and assembly. Several industry case studies will also be discussed in the course to examine the implications of producing a variety of products and strategies for effective mass customization and product postponement.

Students interested in taking this course should be familiar with product design and manufacturing.

Students are evaluated through individual and group homework assignments, in-class participation and activities, and a
group project report and presentation.

I E 549 (EDSGN 549) Design Decision Making (3) Complexity of design decision-making; state-of-the-art methods and tools.

I E (EDSGN) 549 Design Decision Making (3)

Students in this course will internalize the importance of information and decision-making in design; understand the complexities due to uncertain information, multi-person decision making, technology obsolescence, competitive priorities; become familiar with state-of-the-art methods and tools for design decision-making; and, demonstrate the application of this knowledge in the context of a collaborative design project. Learning in this course will be facilitated in an "apply what you have learned" fashion with ample opportunities for students to demonstrate their learning through in-class participation, discussion of solved problems, hands-on design projects. Strategies, methods, and means of the design process will be discussed and practiced to include such things as understanding client needs, generating design concepts, and evaluating design ideas.

I E 552 (BIOE 552) Mechanics of the Musculoskeletal System (3) Structure and biomechanics of bone, cartilage, and skeletal muscle; dynamics and control of musculoskeletal system models.
The course focuses on the upper limbs and its musculoskeletal components, including mechanical properties and models; work-related musculoskeletal injuries, techniques, models, and instruments to measure and quantify the risks for developing such injuries. Specific topics covered in the first third of the course include an introduction to basic biomechanical principles, the anatomical structure of the musculoskeletal system including soft tissue, neuromuscular physiology, and motor control including muscle receptors. The second third covers various muscle models starting from basic mass/spring/dashpot viscoelastic models as in Hill's 3-element model and continuing on to Hatze's multi-element model, frequency analysis, control theory approaches. More complex models include static and dynamic aspects of tendon-pulley models and multiple muscle-tendon systems. The final third covers basic epidemiology as applied to musculoskeletal disorders and risk factors including instrumentation to measure them and various analysis tools (e.g., the PSU CTD Risk Index) to assess the not only the overall risk for injury but the reliability and validity of such assessments. Time permitting applications to hand tools and office environment with computer work stations are examined. Two exams and a modeling project are given. The course is typically offered Spring Semester.

I E 555 Statistical Process Monitoring and Analysis (3) Statistical techniques for univariate and multivariate monitoring of dependent and autocorrelated processes; theoretical and numerical approaches for analyzing performance.

I E 555 Statistical Process Monitoring and Analysis (3)

This is an advanced course in Statistical Process Control (SPC) techniques for process monitoring, one of the main areas of Quality Engineering (QE) methodology. The aim of QE methods is to improve the quality of products used by our society. The widespread and successful use of basic SPC methods have led to the development of many new techniques and procedures over the past 20 years that contribute to that high purpose.

Students should have a background in basic statistical concepts including sampling and sampling distributions, hypothesis testing, confidence intervals, and analysis of variance (ANOVA). This course will give an overview of the traditional SPC methods and time series modeling background, then concentrate on some of the more useful recent developments including univariate and multivariate techniques to monitor autocorrelated data, detect special causes or out-of-control conditions, and identify process changepoint models. A number of practical applications in manufacturing and service fields including polymer processing, nanotechnology, health care, and global sustainability will be considered.

The course objectives are to: (1) understand the basic business and economic principles of process monitoring; (2) know how to select, set up, and use monitoring charts effectively depending on the system characteristics; (3) understand the assumptions and theoretical foundations of process monitoring; and (4) understand and execute methods for comparing different monitoring strategies based on run length distributions. More broadly, students will also know how to research and critique the relevant literature and understand the needs for future research in the area.

Students will be evaluated based on their performance on homework (25%), a mid-semester examination (25%), presentations (25%), a final course project (25%).
I E 556 (M E 556) Robotic Concepts (3) Analysis of robotic systems; end effectors, vision systems, sensors, stability and control, off-line programming, simulation of robotic systems.

Robotic Concepts (3)

I E 557 Human-in-the-Loop Simulation (3) Design and programming of simulations that facilitate human control, real-time discrete-event simulation, supervisory control of dynamic system.

I E 557 Human-in-the-Loop Simulation (3)

This course is designed to provide graduate students with the capability to develop an interactive, real-life simulation and to create interfaces for an interactive simulation. The course will cover key phases in the life cycle of interactive systems development including design, implementation, and evaluation. Course topics will be explored through application in supervisory control of complex, dynamic systems. Java will be the programming language used for software development in this course.

Students will understand the fundamental concepts in interactive simulation; learn how to implement random variant generation and event handling in a simulation; understand the uses of human-in-the-loop simulation to investigate human performance within the simulated system; and demonstrate the application of knowledge gained in the course in a project.

Human-in-the-Loop Simulation is designed for students interested in human interaction with simulations of dynamic, supervisory control systems. The design and implementation of real-time interactive simulations will be covered. The construction of simulations from basic object-oriented programming concepts will be discussed. The role of the human within a dynamic, supervisory control system and methods of evaluating human performance within the simulated system will be examined.

Students will be evaluated via laboratory assignments, two mid-semester examinations, and a semester project.

I E 558 Engineering of Cognitive Work (3) Information processing and decision making models of the human in the modern workplace, emphasizing visual inspection and other industrial applications.

Engineering of Cognitive Work (3)

I E 559 Law and Technology: Products Liability (3) A seminar course on one area of law and technology, products liability.

Law and Technology: Products Liability (3)
**I E 561 (EDSGN 561, CSE 561, IST 561)** Data Mining Driven Design (3) The study and application of data mining/machine learning (DM/ML) techniques in multidisciplinary design.

**I E (EDSGN/CSE/IST) 561 Data Mining Driven Design (3)**

This course examines how theoretical data mining/machine learning (DM/ML) algorithms can be employed to solve large-scale, complex design problems. Knowledge Discovery in Databases (KDD) is the umbrella term used to describe the sequential steps involved in capturing and discovering hidden, previously unknown knowledge in large databases.

The course begins with foundational information regarding engineering design and provides an overview of KDD and the emergence of the digital age. Students will investigate data acquisition and storage techniques where they will learn the difference between stated and revealed data as related to design. Students will construct their own databases and learn essential techniques in data base queries (SQL) and management. Data transformation techniques, such as binning and dimensionality reduction, will be examined in the data transformation section of the course.

This course has a design-driven focus, which will enable students to solve real-life design challenges spanning diverse domains. Students will work on project-based exercises aimed at proposing novel data mining algorithms, or employing existing algorithms to solve design problems in fields relating to engineering, healthcare, financial markets, military systems, to name a few. Data visualization techniques will also be studied to help communicate complex data mining models in a timely and efficient manner.

supply chains with emphasis on computing, algorithms, and dynamics.

**I E 567 Distributed Systems and Control (3)**

Recently several new open architecture standards have emerged for control and information systems in industrial enterprises. These standards have been largely driven by industry to reduce the cost of integrating and configuring manufacturing systems, allowing a new breed of distributed enterprises to be engineered. This course deals with the multidisciplinary aspects of controls, computing, and communication in this rapidly evolving area. The objective of this course is to study current research and engineering challenges in distributed systems and control in the context of manufacturing and service enterprises, and supply chains. Emphasis will be placed on understanding the dynamics and computational aspects of decision making and control algorithms in integrated enterprises. Assignments and projects in this course will include designing, programming, and integrating distributed control systems.

Evaluation will be based on programming and lab assignments, literature review and class presentation, a semester project, and class participation.

This course will be offered every third semester with a maximum enrollment of 18.

**I E 570 (SC&IS 570) Supply Chain Engineering (3)**

Use of operations research models and methods for solving problems in supply chain systems.

The course provides state-of-the-art mathematical models, concepts and solution methods important in the design, control, operation and management of global supply chains. It provides an understanding of how companies plan, source, make and deliver their products to create/or maintain a global competitive advantage. It emphasizes the application of operations research models and methods to optimize the various components of an integrated supply chain. The course is appropriate for graduate students interested in working in the supply chain area in industry as well as those planning to pursue research in supply chain optimization.

**I E 582 Information Technology for Industrial and Manufacturing Engineering (3)**

Students will learn advanced information technology concepts, tools, and techniques for designing and implementing manufacturing systems.

This course provides an in-depth understanding of the state-of-the-art IT concepts and techniques which can be used in manufacturing and Service organizations. Students will acquire a thorough understanding of IT implementation aspects as related to both these sectors. The three major course objects are: (1) to give students an in-depth understanding of fundamental IT/Computing concepts as related to manufacturing and service functions, (2) to provide students with a thorough understanding of the implementations aspects of IT concepts as related to manufacturing and service functions, and (3) to foster students collaborative learning and real life implementation experiences through an industry based project.

All the course modules will be introduced through cases. This course will consist of five to six programming homework assignments, two examinations and one industry based project. Jave will be used as the implementative vehicle for all homework assignments. The industry based project will be implemented as per the needs of the industry working with the students.

I E 583 Response Surface Methodology and Process Optimization (3) Response Surface Methodologies used for sequential experimentation and optimization of production processes. Statistical design and analysis of such experiments.

I E 583 Response Surface Methodology & Process Optimization (3)

This course considers Response Surface Methodology (RSM), a collection of statistical and optimization techniques aimed at improving the quality characteristics of a manufacturing process through the sequential application of statistically-designed experiments and model-building techniques. Optimization techniques for response surfaces, functions that can exhibit large sample variability, are highlighted. Multiple response optimization problems, which occur frequently in practice, are considered, and their relation to Taguchi's Robust Parameter Design problem is emphasized. The course also includes an introduction to the design, analysis, and optimization of mixture problems, which occur frequently in food manufacturing, metallurgy, and semiconductor manufacturing. The practical aspects of RSM are considered through a final project in which the students optimize a (simulated) manufacturing process. For this purpose, a Web-based process simulator has been designed. The software packages Design Expert, SAS, and MINITAB will be used by the students in the class. MATLAB and MAPLE programs will support some of the topics in the class. Recent papers from the technical literature will be covered. The prerequisites of this course are either I E 511, which is an introductory course in Design of Experiments, or STAT 501, an introductory course to linear regression.

I E 584 Time Series Conrol & Process Adjustment (3)

With modern sensor technology, quality control data frequently exhibits dynamics due to the short time between observations. Quality specifications keep "shrinking", and process drift is less tolerated than before. Under these circumstances, Statistical Process Control (SPC) techniques cannot be applied, and the emphasis in quality control moves from monitoring a process to actively adjusting it. Time Series techniques are ideal tools for developing such process adjustment strategies. This course covers topics of recent interest both in academia and in industry, including: integration of feedback adjustment techniques with traditional SPC methods; the "run-to-run" control problem as it occurs in discrete-part manufacturing (e.g., semiconductors); and optimal design of proportional-integral and EWMA controllers. In addition, a detailed treatment of statistical identification and estimation of ARIMA and discrete-time transfer function processes is presented. The effect of data autocorrelation on the performance of SPC control charts is discussed, and process adjustment strategies are presented as an alternative. For this reason, ABIMA modeling is discussed in detail as a means to represent data autocorrelation. Use of the MATLAB and SAS software packages are encouraged. A book on the course subject matter is under preparation and has been accepted by John Wiley & Sons who will publish it in its Probability & Statistics Series. Given the heterogeneity of the students taking the course, the prerequisites are rather modest, and the course is almost self-contained. The prerequisite is I E 423, or a similar introductory course in statistical process control.

I E 588 Nonlinear Networks (3) Foundation in congestion games, including elements of non-cooperative game theory, equilibrium network flows, Braess paradox, and the price of anarchy.

I E 588 Nonlinear Networks and the Price of Anarchy (3)

This course examines the theory of congestion games, developed originally to describe flows on congested transport networks but recently embraced to model data networks. Students will learn how to formulate descriptive models of traffic and data network flows in the presence of congestion as Nash games expressed as variational inequalities (VIs). These models will be used to derive theoretical bounds on the price of anarchy (the social costs of not achieving a truly cooperative or system optimal flow). Students will also learn how to formulate normative network design problems and Stackelberg games or so-called mathematical programs with equilibrium constraints (MPECs) to avoid the Braess paradox. Numerical techniques for solving VIs and MPECs will be discussed and illustrated.

The course begins with an introduction to so-called system optimal network flow models that explicitly incorporate network congestion. The study of system optimal flows contains an introduction to nonlinear network optimization algorithms, including feasible direction, gradient projection, simplicial decomposition and affine scaling algorithms.

Following the consideration of system optimal flows, both atomic and non-atomic network equilibrium models in the form of non-cooperative Nash games are discussed in depth. The price of anarchy is presented as the ratio of the cost of Nash equilibrium flows to the cost of system optimal flows within the network of interest. Various theoretical bounds on
the price of anarchy are derived. Numerical experiments to determine the price of anarchy are also described.

The Braess paradox, wherein global congestion can increase when local capacity is added to a nonlinear network, is introduced and its relationship to the price of anarchy demonstrated. Discrete and continuous equilibrium network design models that eliminate any possibility for the Braess paradox to arise are articulated. Each such design model is shown to be equivalent to a Stackelberg game, which is a type of mathematical program with equilibrium constraints (MPEC).

Mechanism design in the form of network congestion pricing to alleviate the effects of congestion is also considered and show to have an MPEC structure as well. Algorithms for solving MPECs to ascertain efficient network topology/efficient tolling will be discussed in detail, including simulated annealing and other types of computational intelligence on the one hand; and duality, penalty, decomposition and other types of nonlinear programming algorithms on the other.

Students interested in taking this course should have completed a course in linear programming (I E 505); a course in nonlinear programming is also recommended.

I E 589 Dynamic Optimization and Differential Games (3) Dynamic optimization and dynamic non-cooperative games emphasizing industrial applications.

I E 589 Dynamic Optimization and Differential Games (3)

This course provides an introduction to dynamic optimization and dynamic noncooperative games from the perspective of infinite dimensional mathematical programming and differential variational inequalities in topological vector spaces. The objective of this course is to give a working knowledge of computational methods for and applications of dynamic games. It builds on two prerequisite courses - introduction to operations research and linear programming - and also on co-requisite course in non linear programming. Coverage includes descent, projection and penalty algorithms for infinite dimensional mathematical programming and their extension to differential variational inequalities and dynamic games. Cournot-Nash-Bertrand and Stackelberg dynamic games are then studied from the point of view of differential variational inequalities and optimal control problems constrained by differential variational inequalities. Manufacturing and service engineering applications are employed to illustrate the tools developed in the course.

Students will be evaluated on the basis of a set of assigned problems (30%), a semester paper (30%), and a final examination (40%).

Ph.D. Dissertation Full-Time (0)

Thesis Research Off Campus (1-15)

I E 611 Ph.D. Dissertation Part-Time (0) No description.

Ph.D. Dissertation Part-Time (0)

Industrial Health and Safety (I H S)

I H S 500 Occupational Safety Engineering (3) Provides a basis to assist students in understanding/applying the scientific and engineering principles associated with the field of safety.
I H S 500 Occupational Safety Engineering (3)

I H S 500 provides a basis to assist students in understanding and applying scientific and engineering principles associated with the field of safety. Specifically, the course will provide a background in, information on, and application exercises in natural, chemical, and physical laws and forces associated with safe design and implementation of tasks and projects involving soils and excavation, trenching and shoring, permanent and temporary work platforms and scaffolding, cranes, rigging, ropes, slings and chains, fall protection, pressure vessels, confined space entry, energy isolation, and preparation of equipment, hot work, welding, personal protective equipment, and non-destructive testing.

The course will also address safety-related issues associated with building and facility design and layout, job, task, and work setting layout. The course will stress the importance of safety engineering as part of both the corrective process and the design process. At the conclusion of the course, participants should be able to: 1) demonstrate an understanding of the natural laws, chemistry, physics, and design parameters associated with excavation and trenching, confined space entry, hot work, welding, fall protection, and the use of cranes; and 3) design tasks and projects associated with excavation and trenching, confined space entry, energy isolation, hot work, welding, fall protection, and the use of cranes.

This would include specifying the equipment to be used, assignment of appropriate job positions, specifying all appropriate preliminary analysis and design reviews to be done, establishing an inspection and audit process and specifying all required and recommended protective equipment (based on required noise reduction ratings, impact protection requirements, glove and suit permeability and compatibility requirements, etc.).

Demonstration of competencies will be through acceptable performance on exams, homework problems, class participation, and course design project. The course will be offered once per year, and the enrollment limit is 20 students. The format of the course will be lecture-based with demonstrations and applications exercises.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2002
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

I H S 510 Occupational Health (3)

This course provides an introduction to occupational health with an emphasis on practical aspects that can be applied by industrial health and safety professionals. At the conclusion of the course, it is expected that participants will have an understanding and working knowledge of important occupational health concepts including: the development of occupational health professions in the United States, the roles of different I H S professionals in the workplace, commonly encountered hazardous workplace exposures, types of occupational disease, and techniques for the recognition and prevention of occupational disease. Evaluation will be based on written mid-term examinations and a comprehensive final, homework assignments, and a class project in which teams will be formed to argue opposing sides of selected occupational health topics. The course will be offered annually with enrollment limited to 20 students.

Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
environment, including industrial processes, hazards, labor, and corporate structure, so that hazard control programs and feasible implementation plans can be formulated. The course consists of: (1) presentations by faculty and students on specific topics in industrial health and safety, (2) visits to several different industrial sites, and (3) preparation of individual written reports. Grades will be based on one individual oral presentation describing the occupational safety and health concerns of an industry chosen by the student (30%), and two individual reports (35% each). One written report will be on the same subject of the oral presentation, while the second will focus on one of the site visits. The course will be offered annually with enrollment limited to 20 students.

I H S 590 (ENNEC 590) Colloquium (1-3) Continuing seminars that consist of individual lectures by faculty, students or outside speakers on energy and mineral engineering issues.

I H S (ENNEC) 590 Colloquium (1-3)

The objective of the course is to expose students through a seminar format to a wide range of topics on energy and mineral engineering. The lectures would be presented by faculty, students and guest speakers. Students would be required to write a short summary of each presentation and provide a critique of the presentation. Seminar topics will cover aspects of energy production, processing, utilization, and conservation, and the associated environmental, health and safety, and policy, economics, and management issues. Students are expected to keep up with current developments on each topic and to actively participate in the discussions. Students will be evaluated based on their class participation, and written summary and critique of each presentation. This is a required course in the energy and mineral engineering graduate program.

Information Sciences And Technology (IST)

IST 402 Emerging Issues and Technologies (3 per semester/maximum of 9) Introduction to emerging issues, technology forecasting and analysis; overview of emerging issues and leading technologies in IST and how they impact information systems, users, the IT labor force and society.

IST 402 Emerging Issues and Technologies (3 per semester/maximum of 9)
Information Sciences and Technology (IST) is a rapidly changing discipline. New issues, methods, tools, applications and terminology appear on a continual basis. A key skill is the ability to analyze new issues and assess new technologies within the context of the information age. This course prepares students to understand the difference between potential technological failures and success, fads and revolutionary technology. It also helps students to view emerging issues as an opportunity rather than a threat. Intellectual tools are provided to assist in understanding issues, assessing and forecasting technological changes for feasibility and planning in real world situations. The course provides students with:

a.) A process framework for analyzing new issues and a theoretical framework to study technological and social impacts

The Pennsylvania State University
of such issues.
b.) A process framework for recognizing and understanding new technologies and a theoretical framework to take
advantage of such technologies.
c.) Exposure to new issues and technologies.
d.) Hands-on experience in studying recent technological advances in detail.

The course will also provide students with the ability to:
a.) Understand the concept of issue analysis and technology forecasting.
b.) Recognize the important of new issues and technologies in information sciences.
c.) Incorporate these new issues and technologies into an existing information systems framework.
d.) Develop and implement new technology solutions, or discuss policies for addressing emerging issues.
e.) Predict impacts of issues and technology on information management, users, policies, and the environment.

Each time the course is offered; new issues and or information technology areas will be explored. Examples of issues and
technologies addressed include: wireless communications, security and intrusion detection, intelligent agents, web search,
languages, intelligent systems, bio-informatics, advanced visualization and human-computer interactions,
ubiquitous-pervasive computing, groupware, computer aided cognition, system design by global IT teams, IT
outsourcing, and digital divide.

IST 411 Distributed-Object Computing (3) Introduction to distributed-object computing and its use in client/server and
real-world computing applications.

IST 411 Distributed-Object Computing (3)

This course presents the fundamental concepts of distributed-object computing with applications to client/server
computing which is an important platform for real-world computing systems. The course focuses on tools and techniques
used in the design, development and deployment of client/server systems, including traditional architectures and also
distributed-object technologies. Students will also consider issues of managing client/server systems and the
relationships between organizational processes and information-system architectures. IST 411 will be an elective course
for the Baccalaureate degree program in Information Sciences and Technology. It is expected that students completing the
Systems Development Option may take this course to fulfill requirements for the option.

No other course offers an introduction to distributed objects and client/server applications. CMPBD 450 covers network
operations, but not the problem of distributed computing. IST 311 and 414 provide general introductions to software,
object-oriented design, and applications, but do not address problems specific to client/server architecture and
distributed computing. CSE 513 covers the fundamentals of distributed systems and is far more advanced and theoretical
than is necessary for IST.

Upon completion of this course, students will have a broad understanding of the fundamental concepts of distributed
objects and distributed-computing architectures, and have the ability to apply these concepts to real-world applications.
They will receive a broad examination of the major issues surrounding the design, development, deployment, and
maintenance of client/server applications, and have the ability to construct such systems. The student will also have
experience with current software standards, languages, software, and implementation technologies relating to
client/server applications, and have the ability to use these in real-world applications. Student performance will be
evaluated by means of assignments, examinations and optionally, a project or paper.

IST 411 will be offered every semester at University Park. At every other campus location where the Baccalaureate degree
program is offered, the course will be offered 1-2 times annually depending on demand. Student enrollment at University
Park will begin at approximately 50-75 in the first year and grow to 200 over a 3-4 year time period. At other locations,
enrollment should range from 25-50 annually.

General Education: None

check the specific course syllabus.

IST 412 The Engineering of Complex Software Systems (3) Introduction to the engineering of complex software systems
including software system specification, design and implementation, integration and test, and evolution.

IST 412 The Engineering of Complex Software Systems (3)

IST 412 will provide the students with the skills needed to design, implement, test, and evolve complex software systems.
The course will also give students insight into the complexities of managing complex software system projects. It will
also give the students an introduction to the responsibilities or complex software system development including software
reliability and software safety. IST 412 will be an elective course for the Baccalaureate degree program in Information Sciences and Technology. It is expected that students completing this Option may take this course to fulfill requirements for the option.

Following IST 311, which is required for the Systems Development Option, IST 412 is one of three 400-level courses that may be taken to fulfill the option requirements. The prerequisite of IST 311 ensures that the student has sufficient background in the use of programming languages.

Student performance will be evaluated by means of written and programming assignments, examinations, and a team-based complex software system project.

Upon completion of this course, the student will have experience with software systems, designing principles, implementation concepts, testing of a complex software system project and management of a team-based project.

IST 412 will be offered every semester at University Park. At every other campus location where the Baccalaureate degree program is offered, the course will be offered 1-2 times annually depending on demand. Student enrollment at University Park will begin at approximately 50-75 in the first year and grow to 200 over a 3-4 year time period. At other locations, enrollment should range from 25-50 annually.

IST 420 Fundamentals of Systems and Enterprise Integration (3) Introductory course on integration of information technology into different venues, including the planning, development, and implementation of the integration.

IST 420 Fundamentals of Systems and Enterprise Integration (3)

IST 420 focuses on introducing the student to the role of information systems and technologies in achieving a variety of system goals. Emphasis will be placed on the theories and skills required for planning, developing, implementing, and managing the integration of information technology and different systems. IST 420 is required of all Information Sciences and Technology (IST) undergraduates who have chosen the Information Technology Integration Option in their baccalaureate degree. It is the prerequisite for IST 421 which is also required for the Option. Upon completion of the course, the student will be able to recognize information technology integration. They will also understand the "business processes and information value chain" within a system, and be able to foster an understanding of the role of IT in system integration. Students will be periodically assessed through examinations, case studies, individual and group assignments and projects, and other performance indicators where appropriate.

IST 421 Advanced Enterprise Integration: Technologies and Applications (3) Advanced course on the integration of information technology into systems applications.

IST 421 Advanced Enterprise Integration: Technology and Applications (3)

The Pennsylvania State University
IST 421 expands the knowledge gained in IST 420 on the theories and skills required for planning, developing, implementing, and managing information systems. IST 421 is required of all Information Sciences and Technology (IST) undergraduates who have chosen the Information Technology: Integration and Application Option in their Baccalaureate degree. Upon completion of the course, the student will have expanded knowledge of information technology and systems integration issues across multiple application settings. They will also have a deeper understanding of the specific information technology (both hardware and software) that can serve as the foundation for designing systems within an organization, and have experience that fosters an understanding of the role of IT achieving system performance goals.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2004

IST 423 Enterprise Information Management and Storage Architecture (3) Provide in-depth study of the concepts, issues, and technologies associated with the complex world of enterprise information and storage architecture.

IST 423 Enterprise Information Management and Storage Architecture (3)
This course is designed to introduce students to enterprise information storage and management concepts, issues, trends, and technologies. As a junior/senior level course, the focus will center on applying design concepts and associated technologies to real-world problems in the area of enterprise information storage and management. Existing partnerships with leading information management firms will be leveraged to provide real-world exposure to the complex enterprise information storage and management issues facing all organizations today. This course also focuses increasingly on the critical areas of information security and the emerging field of information storage virtualization. The course will mix technical details, applied value, and organizational insights of enterprise information storage and management through the use of labs, case studies, real-life problems, and team projects. This is a unique course that has generated great industry interest.

IST 424 Architectural Modeling of Organizations (3) Theoretical foundations and practice of enterprise modeling.

IST 424 Architectural Modeling of Organizations (3)
Enterprise Architecture is the overall framework and set of strategic objectives for the usage of technology over time across an organization. Enterprise Architecture can also be described as the top-down, strategy-driven, integrating framework that brings together and manages the organization model, applications and technology. Its primary goal is to facilitate improvement and deliver organization-aligned information systems. Effective modeling is crucial for successful EA. This course provides an exposure to the foundational concepts and practices of effective enterprise modeling for EA.
Graduate Bulletin Archive - 2014 2013 - 2014

Students will acquire knowledge about the key foundational knowledge in modeling different layers of the enterprise, learn what decisions need to be made and how to make them, and be able to explain and justify their models and recommendations. This course explores the use and effectiveness of architectural modeling to describe an organization and to integrate and manage IT resources strategically from an enterprise perspective. Hands-on exercises and cases studies are used to illustrate the role and effect of enterprise architecture concepts and methodologies. Emphasis is placed on understanding different architectural approaches, standards, and styles. Students will use enterprise architectural tools to develop descriptive models and understand how to integrate and manage IT within and between organizations.

For each general topic area, core readings are used to define standard vocabulary, concepts and relations, methods and criteria for evaluation, and implications for enterprise architecture. Students participate in class discussions as well as complete written assignments that focus on solidifying the understanding of the course content. Students also complete a team modeling project that is motivated by, and whose outcomes are discussed with respect to, one or more theoretical frameworks covered in the course.

IST 425 (MGMT 425, ENGR 425) New Venture Creation (3) Via problem-based learning, teams define new business ventures to meet current market needs, develop business plans, and present to investors.

IST (MGMT/ENGR) 425 Introduction to Entrepreneurship (3)

The goal of IST (MGMT/ENGR/ENTR) 425 is to better prepare undergraduate students to be business leaders in adaptive, globally-minded, technology-savvy companies. The course is structured so students develop skills that are of high value in any workplace: they develop improved leadership skills, higher self-efficacy, creativity and the ability to deal with ambiguity. On course completion, students will have a working knowledge of traditional and non-traditional ways for identifying a new product or business opportunity, quantifying the potential, understanding the key competitive factors, researching the audience and producing a convincing executive summary for internal or external financing and launch. Students who want to augment the skills and knowledge from their major with the ability to refine a new product/service process in an interdisciplinary team will find IST (MGMT/ENGR/ENTR) 425 a valuable course.

This is a novel problem-based learning (PBL) course, where the learning is student-centered, with faculty acting primarily in the role of facilitators. Active learning happens in this course because students develop ownership in their new business venture concept and are fully responsible for the genesis of the idea. The course leverages the on-line course management system (ANGEL) to define weekly learning objectives, support electronic delivery of assignments, robust video content with entrepreneurs is provided on CD-ROM or via ANGEL, providing additional insights into entrepreneurship. The technology or business segment focus of the class is easily adapted by using different case studies and course mentors.

This will be one of two courses in the new two-course sequence for business students in entrepreneurship. This course will be accepted as a supporting course in the Engineering Entrepreneurship Minor (E-SHIP) and in the Engineering Leadership Development Minor (ELDM). IST (MGMT/ENGR/ENTR) 425 can be used as a technical elective in many of the engineering departments. It will be accepted as a Support of Option course for the Information Sciences and Technology (IST) major.

IST 426 (ENGR 426, MGMT 426) Invention Commercialization (3) Working with Penn State inventions selected by the Intellectual Property Office, student teams define an optimum commercialization path each technology.

IST (MGMT/ENGR) 426 Invention Commercialization (3)

The goal of IST (MGMT/ENGR/ENTR) 426 is to have students understand why invention commercialization is complicated and difficult by participating in the process. For example, the inventor rarely has insights into the markets for his/her invention, is often not interested in the details of commercialization, and can be secretive. In addition, the business and financial communities often do not take the time, or have the resources, to understand new technologies and perform complex due diligence. Thus lack of due diligence often leads to rejection of innovation because existing companies often discount new technologies from outside the company as NIH - "not invented here".

Effective transfer of new invention or innovation to a commercial product requires at least three different functional communities to interface: technical, legal and business. Each uses a different language, comes from different educational backgrounds, and has different perspectives on the process. Students will develop the knowledge and skills to understand the technical aspects needed for success of their invention, the legal aspects of the process, and the business aspects of the process. In the role of facilitators. Active learning happens in this course because students develop ownership in their new venture concept and are fully responsible for the genesis of the idea. The course leverages the on-line course management system (ANGEL) to define weekly learning objectives, support electronic delivery of assignments, robust video content with entrepreneurs is provided on CD-ROM or via ANGEL, providing additional insights into entrepreneurship. The technology or business segment focus of the class is easily adapted by using different case studies and course mentors.

This will be one of two courses in the new two-course sequence for business students in entrepreneurship. This course will be accepted as a supporting course in the Engineering Entrepreneurship Minor (E-SHIP) and in the Engineering Leadership Development Minor (ELDM). IST (MGMT/ENGR/ENTR) 426 can be used as a technical elective in many of the engineering departments. It will be accepted as a Support of Option course for the Information Sciences and Technology (IST) major.

The Pennsylvania State University
and cultural backgrounds, and may have an inherent distrust of the others. These functional barriers are difficult to overcome.

This course teaches how these barriers can be broken down as student teams help bridge the perceived chasm between key players in the invention commercialization process. In these teams, students bring the skills and knowledge from their major to develop an invention commercialization recommendation for the Technology Transfer Office and the inventor. For example, business students focus on finance and market opportunity assessment; engineering and IST students focus on design refinements, prototyping support, and (if appropriate) making technology suggestions to the inventor.

Upon completing the course, the students will have a working knowledge of different university and corporate technology or invention commercialization processes, important intellectual property management tools for inventions (patents, license agreements, option agreements) source of funding to move inventions toward product development, and delivering top quality presentations which outline the recommended commercialization path. Students who enjoy open-ended projects which involve the interplay of business and invention of who wants to work on interdisciplinary teams with the newest inventions will find this course a valuable course. NOTE: Because the inventions/products are based on Penn State faculty intellectual property, students must sign the Penn State Special Intellectual Property Agreement For Students - For Use When Assigning Intellectual Property to The Pennsylvania State University. The form can be viewed at http://guru.psu.edu/policies/RAG13.html

IST 431 The Information Environment (3) Survey of social environment of information technology themes: Community, sovereignty, privacy, ethics, economics, and knowledge management.

IST 431 The Information Environment (3)

The ways that people communicate and utilize information is being changed dramatically by new information technologies. Information and the technologies that are employed by create, organize, transger, and utilize that information in a networked environment, using such global networks as the internet or internal networks such as intranets, have become a key component of the global economy. This global environment can change the way we interact, communicate, and function on the job and in our daily lives. The new technologies also raise new economic, legal, ethical, and social issues that are of grave importance to society. IST 431 examines the overall context of the new information environment and new technical issues relating to knowledge management in the global networked environment. IST 431 is a required course in the Information, Society and Public Policy Option.

There may be some overlap of material with COMM 405, COMM 483, COMM 485, PHIL 407, PHIL 423, PHIL 433 and PL SC 460m but none of these courses cover the same material, or approach it in the same manner.

Upon completion of this course, the student will gain an appreciation of the differences between "cyberspace" and the "real" world. The student will also understand that the implementation and modern information technologies has significant social and policy implications that demand appropriate policy issues in several different contexts (global, national, local). The student will also be able to discuss the major themes in information policy studies (e.g., community, privacy, access, economic participation, security) and be able to relate these themes to the applications of particular technologies. They will be able to describe policy frameworks and issues, as well as the ethical and social implications of these choices.

Homework assignments; Socratic dialogue; analysis and write-up of case studies; assessment of group research projects and presentations; participation in on-line discussion groups; two mid-term and one final examination (objective and essay). The precise mix of evaluation components will be determined by individual instructors; a typical weighting might be exams (60%), written assignments and papers (20%), and collaborative projects (20%).

IST 431 will be offered every semester at University Park. At every other campus location where the Baccalaureate degree program is offered, the course will be offered 1-2 times annually depending on demand. Student enrollment at University Park will begin at approximately 50-75 in the first year and grow to 200 over a 3-4 year time period. At other locations, enrollment should range from 25-50 annually.

IST 432 Legal and Regulatory Environment of Information Science and Technology (3) Legal environment of information technology, constitutional/political issues, intellectual property, management, e-commerce, privacy, access, computer contracting, cyberspace regulation.

IST 432 Legal and Regulatory Environment of Information Science and Technology (3)

The Pennsylvania State University
The new information technologies are creating a global economy heavily dependent upon networked information, hardware, software, and electronic commerce, which calls for adaptation of existing legal and business practices. In many cases, the new technologies pose problems that existing laws or legislation are inadequate to cope with; but the complexity of the environment makes new solutions elusive. This course examines the legal, regulatory, and political environment within which intellectual property rights and examination of contracting issues, licensing of information and products, data protection, patents, cyberspace regulation, and implications for personal privacy. It also focuses on where technology is making regulation difficult by challenging previous concepts upon which our legal and regulatory systems depend.

IST 437 Digital Design & Innovation (3) This course introduces students to design thinking, user-driven innovation and user experience, and business model implementation issues for IT-driven innovation.

IST 437 Digital Design & Innovation (3)

IT-driven innovation requires a deep understanding of the user, the context of the computer environment, and a systems approach to identifying critical system features. In addition, the IT-driven innovation must meet user needs in a commercially feasible manner. Students taking this class will work in teams to create a design concept and refine it through user analysis and prototyping. To get to a commercially feasible concept, students will analyze the competitive landscape and the ecosystem in which their concept will reside. Each team will express their concepts using the Business Model Canvas—a tool used in both educational and professional settings—to identify the value proposition and potential monetization strategies. Throughout the class, students will be introduced to tools in the IT design space through hands-on problem solving, role playing, and improvisation, among other techniques. A critical part of this course is the in-class coaching that teams will receive from the instructor, as well as guest speakers who can demonstrate the real world challenges of entrepreneurship and innovation. Frequent communication practice using techniques such as idea pitches will help students refine their ability to express their ideas more effectively.

IST 440W Information Sciences and Technology Integration and Problem Solving (3) Problem-based approach to technology integration by focusing on real-life problems faced by an organization.

IST 440W Information Sciences and Technology Integration and Problem Solving (3)

This course is the undergraduate capstone for Information Sciences and Technology majors in the Baccalaureate degree. It requires students to work collaboratively in teams of 4-6 students, with each team comprised of students from more than one option and, if possible, more than one campus. Each team is given a significant real-world problem or issue in which information technology is part of the solution. Teams will be expected to manage the project effectively and to communicate its results clearly to a variety of audiences within an organization. Major topics include: review of problem-based and case-based learning; overview of project management practices; assessment of organizational and technical issues posed by the scenario; development and testing of work plans and analysis of options; communication within the group; communication within a management environment; and presentation of results to a variety of audiences inside and outside the organization.

IST students need to understand the organizational and social contexts in which technology functions. Indeed, many technology problems are multi-dimensional—they have an economic dimension, a legal dimension, a human resources dimension, and so on. This course will require students to analyze, evaluate, and test alternative solutions and to weigh their advantages and disadvantages for the organization.

Students will be evaluated in three ways: by the effectiveness of their team’s solution of the technical or organizational problem; by the quality of the students’ written and oral presentations; and by the quality of their project management and internal communication. A substantial written paper will be required of each student and each time; in addition, each team will also construct a Web-site for sharing results. Other technologies will be used as required by the project.

It is expected that membership on teams of students will be drawn from the various options in the Information Sciences and Technology major. At least nine credits (including at least one IST 300-level and one IST 400-level course) in the student’s option must be completed before enrollment in IST 440W. This course should be offered every fall and spring semester beginning in the fall semester 2002. It will be taught in sections of 25 and have a total enrollment of approximately 100 per semester.
IST 441 Information Retrieval and Organization (3)
Introductory course for seniors and graduate students covering the practices, issues, and theoretical foundations of organizing and analyzing information and information content for the purpose of providing access to textual and non-textual information resources. Introduces students to the principles of information storage and retrieval systems and databases.

IST 442 Information Technology in an International Context (3)
This is an introductory course for Information Sciences and Technology senior and graduate students covering the practices, issues, and theoretical foundations of organizing and analyzing information and information content for the purpose of providing access to textual and non-textual information resources. This course will introduce students to the principles of information storage and retrieval systems and databases. Students will learn how effective information search and retrieval is interrelated with the organization and description of information to be retrieved. Students will also learn to use a set of tools, such as search engines, and procedures for organizing information. They will become familiar with the techniques involved in conducting effective searches of information resources.

IST 443 IT Professional Services Theory and Practice (3)
Explores and applies the basic concepts, methodologies, tools, and techniques of consulting and professional service organizations in information sciences and technology.

IST 444 IT Professional Services Theory and Practice (3)
This course is designed to introduce students to basic IT professional services theories and practices, including an examination of the professional services industry. A consulting-oriented systems life cycle framework is used as the outline of the course. The phases of this framework include: problem/system analysis and evaluation, requirements definition, solution design, solution development, solution implementation, and on-going evaluation and maintenance. Students will learn how to identify and define client problems, map workflows, develop recommendations, and prototype solutions. They will be given opportunities to practice the concepts and methodologies they learn by working on real-world problems in teams for corporate clients.

This course is designed around real-world problems and projects involving IT systems development, integration and implementation. In this course, the student will be part of a consulting team that is assigned to work with a real corporate client. The student works with the other team members to define their client's problem, map out appropriate workflows, and make recommendations for a solution. Depending on the project, the recommended solution may be prototyped or fully developed during the course.
IST 444 Advanced IT Professional Services (3) Explores advanced IT professional services topics, and the unique application of consulting methods in various industry sectors.

This course is designed to allow students to explore in-depth IT professional services issues and strategies. The advanced topics to be covered during the semester include IT strategy consulting, consulting leadership issues, complex and/or strategic consulting methodologies, IT governance consulting, and an in-depth analysis of professional service firm operations and strategies, and the management of multiple, simultaneous projects and initiatives. This course is designed around real-world issues and projects involving problem identification, advanced research methods, IT solution development, integration, and implementation, primarily from a strategic and/or program management perspective. Furthermore, students will explore the culture, operations, and strategies of large, medium and small IT services organizations. The student will understand leadership and managerial issues associated with strategic alignment of IT and business strategies, executive-level stakeholder management, program management, IT strategic planning, and managing the political landscapes of large-scale IT consulting projects.

IST 445H Globalization Trends and World Issues (3) This course covers trends in globalization and their influence on U.S. policy making as well as the role of the U.S. in international issues.

IST 446 An Introduction to Building Computer/Video Games (3) An interdisciplinary course that introduces students to process and techniques involved in developing a video or computer game.

The course is project driven. Students will form teams and collaborate with one another to develop an interactive immersive experience. During the course, students will be exposed to several techniques for building graphical 3D worlds, animating characters, moving the camera and lights in real-time, and building intelligent characters (using state machine-based architectures). They will also learn different techniques of interactive storytelling, such as linear narrative, branching narrative, and adaptive narrative. Furthermore, they will be introduced to several tools that will aid in realizing their own projects and ideas, such as graphic engines (e.g. Wildtangent), and game engines (e.g. Unreal Tournament).

The course is heavily project driven. Students will, in the first half of the course, learn the tools used in the development of interactive 3D environments. They will submit 2 individual assignments using these tools to develop a simple interactive environment. These individual assignments will be graded and critiqued.

In the second half of the course, students will work on a game idea from generation to actual implementation. Students will be grouped in teams of three to develop a project, integrating concepts they learned through the class. They will use one or more of the tools they learned to build this project. Projects will be continuously evaluated and critiqued during game tuning sessions. In addition, projects will be formally evaluated through two prototypes that are critiqued by the class and the instructor. The students will continuously revise their designs and projects through the semester. The final version of the system is due by the end of the semester.
IST 451 Network Security (3)

Information technology has become a key component to support critical infrastructure services in various sectors of our society. In an effort to share information and streamline operations, organizations are creating complex networked systems and opening their networks to customers, suppliers, and other business partners. Increasing network complexity, greater access, and a growing emphasis on the Internet have made information/network security a major concern for organizations.

IST 451 focuses on network security. The course will provide the students with a comprehensive understanding of the fundamental issues and concepts of network security, and the mainstream network security technologies and protocols that are widely used in the real world. The course will also address emerging technologies in network security.

A major component of the course will be several team-based hands-on attack-defense projects. Each project has two phases: the attack phase and the defense phase. A group may be asked to defend against the attacks enforced by another group. This course will incorporate collaborative and action-learning experiences wherever appropriate. Emphasis will be placed on developing and practicing writing and speaking skills through application of the concepts, theories and technologies that define the course.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IST 452 Legal and Regulatory Environment of Privacy and Security (3)

IST 452 Legal and Regulatory Environment of Privacy and Security (3) Exploration of legal, regulatory, public policy, and ethical issues related to security and privacy for information technology professionals in public institutions, private enterprise, and IT services.

IST 452 Legal and Regulatory Environment of Privacy and Security (3)

Institutional constraints on security historically focused on traditional criminal enforcement and a slow but steady increase in civil remedies through the twentieth century. Professional security protection could satisfy reasonable assurance criteria by managing legal and regulatory risks based on commonly-held understandings of burglary, theft, conversion and widely-understood but related institutional constraints in the protection of physical property. This focus retained effectiveness so long as physical security over tangible property appeared successful, even extending to the maintenance of control over mainframe computers and their peripherals. However, the proliferation of networked computers has made access and storage ubiquitous, vastly increasing the vulnerability of confidential data, private information and critical national security infrastructure. Security and privacy regulation compliance responsibility now falls much more harshly on both organizations and most of their individual personnel. These complex new duties constrain organizations in the data management industry as well as suppliers and users of data and all participants in the information supply chain, including consultants, software suppliers, applications service providers, maintenance, outsourcing and communications providers.

Other factors exacerbate these liability risk management difficulties. Advances in network computer storage and use, the broadening perception of heightened value of information and the pervasive availability of rich data warehousing increase the vulnerability of data management. Risks of information theft and integrity losses as well as the explosion of privacy rights and national security concerns now require pervasive and fuller understanding of liability risk management principles/techniques among all managers and subordinates in the data management industry and in government. Information suppliers, handlers, owners and network service providers are increasingly exposed to civil litigation, regulatory oversight/compliance and criminal prosecution for various information-related wrongs. For example, confidentiality is compulsory for corporate trade secrets, privacy is required for personally identifiable information about individuals and secrecy is mandatory over matters of national security; all of which create complex legal duties that are fundamentally driving the design of information handling processes. This course surveys legal and regulatory constraints on information security and privacy practices.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IST 453 Legal, Regulatory, Policy Environment of Cyber Forensics (3)

IST 453 Legal, Regulatory, Policy Environment of Cyber Forensics (3) Legal, regulatory and public policy environment of computer and network forensics that constrain investigatory and monitoring activities in computer and network environments.

IST 453 Legal, Regulatory, Policy Environment of Cyber Forensics (3)

This course covers the major legal, regulatory and policy issues in cyber-forensics including, pre-trail discovery, production of electronic documents (electronic data discovery or EDD), custody, EDD cost balancing, admissibility of electronic evidence, “business records,” expert witness roles and qualification, constitutional rights to privacy and

The Pennsylvania State University
confidentiality, privilege, litigation support, forensic service providers, document retention standards, legal constraints on
electronic records management, EDD employment policies, key EDD laws, civil, criminal and regulatory procedure and
evidence, litigation holds, spoliation, obstruction of justice, interaction with inside and outside service providers and
counsel, EDD strategy, audit trails, and multi-disciplinary relations with computer and network forensic experts. Students
are exposed to the failure and successes of particular cyber forensic techniques in the dominant legal and regulatory
forums.

Bachelor of Arts: None
Effective: Summer 2006
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details
check the specific course syllabus.

IST 454 Computer and Cyber Forensics (3) Fundamental issues and concepts of computer forensics; aspects of computer
and cyber crime; methods to uncover, protect, exploit, and document digital evidence; tools, techniques, and procedure to
perform computer and cyber crime investigation.

IST 454 Computer and Cyber Forensics (3)

Computer and communication technologies have become the key components to support critical infrastructure services in
various sectors of our society. In an effort to share information and streamline operations, organizations are creating
complex networked systems and opening their networks to customers, suppliers, and other business partners. Increasing
network complexity, greater access, and a growing emphasis on the Internet have made information and network security
a major concern for organizations.

IST 454 focuses on computer and cyber forensics. Students will learn different aspects of computer and cyber crime and
ways in which to uncover, protect, exploit, and document digital evidence. Students will be exposed to different types of
tools (both software and hardware), techniques and procedure, and be able to use them to perform rudimentary forensic
investigations.

A major component of the course will be several hands-on exercises and a final team-based project. This course will
incorporate collaborative and action-learning experiences wherever appropriate. Emphasis will be placed on developing
and practicing writing and speaking skills through application of the concepts, theories and technologies that define the
course.

Integrated throughout are perspectives of computer and related legal process, including computer crimes from state and
federal law, methods of interaction with law enforcement and prosecutors, admissibility of expert witness testimony and
the use of forensic reports in civil, regulatory and internal investigations.

IST 461 Database Management and Administration (3) Introduces advanced topics in database management systems that are fundamental to effective administration of enterprise information systems.

The objective of the course is to enable a student to comprehend principles of database management and administration. The students will learn how data are stored (indexing), accessed (query processing), shared (currency and transactions), and controlled (security). Students will be creating and using these features in a database in the laboratory. They can then develop, use, and tune database systems and applications, utilizing advanced database management features. This course assumes basic familiarity with relational model, Entity-Relationship diagram, SQL query language, and normalization (as covered in IST 210). It builds the foundation on more advanced concepts of database systems that are fundamental to a career in database administration.

IST 462 Database Modeling and Applications (3) This course introduces advanced topics in database modeling and applications.

The objective of the course is to enable a student to comprehend advanced database modeling and their applications. Students will model requirements using the advanced techniques and implement various applications in different domains. This course assumes basic familiarity with relational model, Entity-Relationship diagram, SQL query language, and normalization (as covered in IST 210). This course will cover more advanced topics in database modeling and database applications.

IST 489H Research Methods for the Information Sciences and Technology (3) Seminar course focused on approaches to studying information and communication technologies and writing theses and other research reports.

IST 489H provides students the opportunity to learn and experience: 1) Conceptualizing what are information and communications technologies. 2) Approaches to conducting research on, and reporting results of studies, of ICT. 3) The research process and its academic context.

The course is designed around a series of ill-structured, contemporary, problems that require students to develop responses by applying research approaches to ICT. At the end of the course, students will be able to: 1) Apply different conceptualizations of ICT to common problems. 2) Select and initiate research on ICT. 3) Begin writing research-oriented work such as theses and papers.

IST 495 Internship (1-18) Supervised off-campus, nongroup instruction including field experiences, practica, or internships. Written and oral critique of activity required.

IST 501 Interdisciplinary Research Methods for Information Sciences and Technology (6)

IST 501 serves as the central foundational course for graduate students who intend to conduct research in IST. Although each student may eventually focus on one or several methods discussed in the course, the College is committed to providing all of its research students an interdisciplinary mindset regarding their own and their peers’ research activities. This mindset is a defining feature of IST research training. As a result it is critical to convey this to new students.

The course provides foundational information regarding three contrasting research perspectives of IST: Social Informatics, Human-Centered Design and Computational Informatics. The three perspectives are presented in an interleaved fashion, one week at a time, with gradually increasing complexity and sophistication in the methods used. The methods address requirements for, design of, and impacts of information technologies used to meet people’s information needs at multiple levels of analysis, including individuals, groups, organizations and national and global cultures. The technologies investigated are of various types, including algorithms, structured data, user interfaces, and distributed systems. Each one-week methods topic is practiced through an individual homework activity and a team project is used to provide an integrated application activity that cumulates throughout the semester.

Through reading of contemporary and classic literature, demonstrations and practice with specific research techniques, and sharing and reflection on individual and team research activities, students will explore fundamental assumptions, theories and directions in contemporary research methods useful to researchers in IST. The emphasis of this course is on defining and developing conceptual linkages between human behavior, the social, organizational and cultural context of information and technology use, human experience when learning or using information and computing technologies, and the construction of information and computing technologies. The interdisciplinary research methods will operate at individual, group and other units of human, social and organizational analysis, and across a range of information technologies.

IST 503 Foundations for IST Research (3)

This course is a study of major methodological, normative, and theoretical issues in philosophy of science related to research in information sciences and technology.

IST 503 Foundations for IST Research (3)

This course is a study of major methodological, normative, and theoretical issues in the philosophy of science related to research in information science and technology. A significant part of this course will involve coordinating issues and problems customarily associated with the philosophy of science in general with current research in information science and technology (IST) in particular. In order to achieve this coordination, the study of classical texts in the philosophy of science will be interspersed at appropriate places with lectures and topics that exhibit relevant faculty research in various IST related disciplines.

The course focuses on the main arguments that have been advanced in Anglo-American philosophy of the science for the period beginning about seventy years ago up to the present. The course contradicts the view of a single unitary "philosophy of science." It shows a series of positions and arguments that continue to lead on to still deeper questions. Usually the student will have adopted one of the classical positions without having examines it or defended it rigorously.

Readings will progress in a historical fashion through arguments that attempt to provide a justification for the truth claims of science. The course will begin with a consideration of logical positivism in its early forms, i.e. the ideas of the Vienna Circle, and the early Wittgenstein's theory of meaning. The course will go on to the writings of Karl Popper, especially as found in his Logic of Scientific Discovery. Continuing the historical development, Kuhn's "The Structure of Scientific Revolutions" will be considered. The discussion will then progress to the Popper-Kuhn debates involving the sophisticated falsificationists (Lakatos) and eclectic approaches like Feyerabend's. Finally, Richard Bernstein's book, Beyond Objectivism and Relativism is reviewed summarizing the debate. This final view strives to uncover the strong points in the opposing positions reviewed early in the course. Then it sets a hermeneutical position which he derives principally from the philosophy of Hans Georg Gadamer. This position amounts to a new and interesting view on how knowledge is attained in science and in life in general.

The course relates the debates in the arguments in the philosophy of science to research issues in IST.

IST 511 Information Management: Information and Technology (3) Introduction to theoretical, computational, and practical issues involved in managing textual, spatial, temporal, and multimedia information in a computerized system.

The objective of IST 511 is to provide an introduction to the theoretical and computational issues involved in managing textual, spatial, temporal, and multimedia information. The course will survey the nature of information in various application contexts (digital libraries, digital government, healthcare information, environmental information, etc) and seek to understand their generic and specific requirements for information management. Students will be exposed to major principles and technologies for information management that are drawn from database systems, and information retrieval (IR) and spatial/geographical information systems literature. Special emphasis will be given to the problems of managing heterogeneous information sources with different ontology, representation, scales, and error characteristics.

This course is required of all Information Sciences and Technology (IST) graduate students under both research Master and Ph.D. degrees. It is a foundation course that should be taken in the first or second year of graduate study. IST 501 is the prerequisite for this course.

For hands-on practice and demonstration purposes, this course requires student access and use of a database management system (such as ORACLE or SQL server), a geographical information systems (Arc View or MapInfo), a information retrieval system, and/or a ERP (Enterprise Resource Planning) system.

IST 520 Foundations in Human-Centered Design (3)
Foundational theories in Human-Centered Interactions used for Human-Centered Design.

Foundations in Human-Centered Design (3)
This course introduces students to the broad area of human-computer interaction and the idea of a theory driven interface, an underlying concept in HCI. To do this, the course starts by outlining relevant aspects of human behavior with respect to technology and how interfaces are developed, the two raw components. Students are then exposed to a tool for creating interfaces and a variety of theories of how users interact with technology on a variety of levels. These theories are validated and supplemented by usability studies. The course completes with a group project based on the readings and theories introduced in the first 12 weeks.

IST 521 Human-Computer Interaction: The User and Technology (3)
Users, models of users, developing the models, technology for creating interfaces; examples of good research and implications for Human-Computer Interface (HCI) design.

IST 521 Human-Computer Interaction: The User and Technology (3)
This course introduces students to the broad area of human-computer interaction and the idea of a theory driven interface, an underlying concept in HCI. To do this, the course starts by outlining relevant aspects of human behavior with respect to technology and how interfaces are developed, the two raw components. IST 525 Computer-Supported Cooperative Work (3)
IST 525 introduces theories, empirical findings, evaluation methods, and design frameworks in computer-supported cooperative work.

IST 525 Computer-Supported Cooperative Work (3)
Students in the course will investigate CSCW challenges and opportunities from the dual perspectives of human-computer interaction and socio-technical systems analysis. They will analyze group interactions and concerns in collaborative...
activities such as written and spoken communication, design, meetings, education, decision-making, and everyday work activities. They will review and critique state-of-the-art CSCW technologies, including text-based and video communication tools, immersive meeting environments, group decision-making, workflow, and knowledge management. These technologies will provide a context for investigating and synthesizing issues related to individual use (e.g., perceptions of cost-benefit), the context of collaboration (e.g., social and cultural norms embodied in systems), and software architecture (e.g., coupling and consistency management). Students will apply their understanding of these issues in evaluation and design projects.

IST 535 Information Technology Valuation, Markets and Innovation (3) This course covers the economic aspects of information technology and innovations.

IST 535 Information Technology Valuation, Markets and Innovation (3)
IST 536 Public and Community Informatics (3) Theories and uses of ICT in public sector and community organizations.

This course provides students the opportunity to learn and experience:
1) The relationships among design, take up and uses of ICT in public sector and community organizations.
2) The findings, approaches and issues with studying ICT in the public sector and community organizations.
3) The ways in which public, private and community spheres interact and how services and provision of services are arranged.

IST 541 Qualitative Research in Information Sciences and Technology (3) Assists IST researchers in their efforts to learn about and employ appropriate qualitative methods in their research.

As information and communication technologies (ICTs) have evolved, so too has our understanding of the role of the human contexts within which information technologies are situated. This has led to the need for appropriate methods of studying information systems and technologies in their context of use. There is a growing consensus that qualitative methods offer important research opportunities for this type of study. Therefore, researchers in such fields as the information sciences and technologies, communication technologies and information systems should have an understanding of the various types of qualitative methods so that they can determine ones that are most appropriate for addressing their particular research problems. The course is complementary to quantitative methods courses, in that it addresses problems that are not amenable to those approaches. For example, studies involving very small groups, individuals, societal level concepts and others often lend themselves to qualitative research techniques.

This course begins by considering research topics that lend themselves to the choice of qualitative research methods. It then proceeds to examine the steps involved in conducting qualitative research. These include: developing the research question(s); choosing a particular research method (such as ethnography, case study or action research); making decisions about approaches to data collection (such as interview or focus group) and analysis (such as coding technique); and producing and publishing the results.

This course explores concrete issues that researchers have encountered in their use of qualitative methods. It does this by drawing upon the collective expertise of distinguished scholars who employ qualitative methods in their own research. The course will examine published work that focuses on research findings as well as that which discusses methodological issues.

IST 554 Network Management and Security (3) Essential skills and knowledge for effectively utilizing networks and Internet technologies to facilitate, manage and secure data communications and applications.

Information technology is an integral part of today's organizations and services. As information systems and networks continue to grow and evolve we are becoming more and more dependent, individually and socially, on them to provide support for the economy, military, education and business. Because of this dependence, network-based information and communication systems are attractive targets for those who would compromise information or disrupt services for economic, social or political purposes.
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IST 555 Intelligent Agents and Distributed Decision Making (3) Distributed decision making theories and agent-based technologies, models and systems with applications in command and control, emergency and resource management.

IST 555 Intelligent Agents and Distributed Decision Making (3)
This course introduces the theory and design of intelligent agents for distributed decision making with applications in grid computing, command and control, emergency management and sensor management. Emphasis will be placed on understanding theories of decision making and using them to model and build relevant agent-based distributed systems for supporting decision making.

IST 557 (STAT 557) Data Mining I (3) This course introduces data mining and statistical/machine learning, and their applications in information retrieval, database management, and image analysis.

IST (STAT) 557 Data Mining I (3)
With rapid advances in information technology, we have witnessed an explosive growth in our capabilities to generate and collect data in the last decade. In the business world, very large databases on commercial transactions have been generated by retailers. Huge amount of scientific data have been generated in various fields as well. For instance, the human genome database project has collected gigabytes of data on the human genetic code. The World Wide Web provides another example with billions of web pages consisting of textual and multimedia information that are used by millions of people. How to analyze huge bodies of data so that they can be understood and used efficiently remains a challenging problem. Data mining addresses this problem by providing techniques and software to automate the analysis and exploration of large complex data sets. Research on data mining have been pursued by researchers in a wide variety of fields, including statistics, machine learning, database management and data visualization.

This course on data mining will cover methodology, major software tools and applications in this field. By introducing principal ideas in statistical learning, the course will help students to understand conceptual underpinnings of methods in data mining. Considerable amount of effort will also be put on computational aspects of algorithm implementation. To make an algorithm efficient for handling very large scale data sets, issues such as algorithm scalability need to be carefully analyzed. Data mining techniques developed in fields other than statistics, e.g., support vector machine in machine learning will be introduced as well.

Students will be required to work on projects to practice applying existing software and to a certain extent, developing their own algorithms. Classes will be provided in three forms: lecture, case study, and project discussion. In cast study, students will be lead through practical problems addressed by data mining techniques. The aim is to provide a detailed view on how to convert real problems into models so that algorithms can be applied appropriately and how to solve possible computational issues. Project discussion will enable students to share and compare ideas with each other and to receive specific guidance from the instructors.
IST 558 (STAT 558) Data Mining II (3) Advanced data mining techniques: temporal pattern mining, network mining, boosting, discriminative models, generative models, data warehouse, and choosing mining algorithms.

IST (STAT) 558 Data Mining II (3)

This course is the second course in a two-course sequence on data mining. It emphasizes advanced concepts and techniques for data mining and their application to large-scale data warehouse. Building on the statistical foundations and underpinnings of data mining introduced in Data Mining I, this course covers advanced topics on data mining; mining association rules from large-scale data warehouse, hierarchical clustering, mining patterns from temporal data, semi-supervised learning, active learning and boosting. In addition, to computational aspects of algorithm implementation, the course will also cover architecture and implementation of data warehouse, data preprocessing (including data cleansing), and the choice of mining algorithms for applications. In addition to discriminative models such as CRF and SVM models, the course will also introduce generative models such as Bayesian Net and LDA.

A term project will be developed by each student to apply an advanced data mining algorithm to a multi-dimensional data set. Classes will include lectures, paper discussions, and project presentations. Paper discussions will allow students to discuss state-of-the-art literature related to data mining. Project presentations will enable students to share and compare project ideas with each other and to receive feedback from the instructor.

IST 561 (EDSGN 561, I E 561, CSE 561) Data Mining Driven Design (3) The study and application of data mining/machine learning (DM/ML) techniques in multidisciplinary design.

IST (EDSGN/CSE/I E) 561 Data Mining Driven Design (3)

This course examines how theoretical data mining/machine learning (DM/ML) algorithms can be employed to solve large-scale, complex design problems. Knowledge Discovery in Databases (KDD) is the umbrella term used to describe the sequential steps involved in capturing and discovering hidden, previously unknown knowledge in large databases. The course begins with foundational information regarding engineering design and provides an overview of KDD and the emergence of the digital age. Students will investigate data acquisition and storage techniques where they will learn the difference between stated and revealed data as related to design. Students will construct their own databases and learn essential techniques in database queries (SQL) and management. Data transformation techniques, such as binning and dimensionality reduction, will be examined in the data transformation section of the course.

This course has a design-driven focus, which will enable students to solve real-life design challenges spanning diverse domains. Students will work on project-based exercises aimed at proposing novel data mining algorithms, or employing existing algorithms to solve design problems in fields relating to engineering, healthcare, financial markets, military systems, to name a few. Data visualization techniques will also be studied to help communicate complex data mining models in a timely and efficient manner.

IST 562 Theoretical Foundations of Information Science (3) This course introduces the theoretical foundations of information science, with applications in communication, signal processing, machine learning, and pattern recognition.

Topics in Visual Analytics for Security Intelligence (3)

- This course surveys techniques for visualizing and analyzing security and risk information and for communicating threats, risk and vulnerability to decision-makers. Students will be motivated by the needs for better intelligence in a broad range of applications such as homeland security, crisis management, and public safety. Through case studies and problem-based learning, students will develop understanding of important concepts and issues, such as data source and data quality, visual thinking associations and integration of incidence, hazards, and risk factors, and the difficulties of analyzing and communicating knowledge. Various visual analytical methods for homeland security intelligence will be discussed, such as: (1) mapping and visualizing patterns of crime and incidence, (2) identifying targets and agents of terrorist attacks, (3) spatial analysis of social, economic and environmental risk indicators, and (4) prediction of threat and risk. It also pays special attention to the interpretation of analytical results for actions. Geographical information systems and associated spatial analytical tools will be used to exemplify the kinds of information environment available to intelligence community. The course will prepare students to become immediate workforce for security-related industries and government agencies.

- General Education: None
- Diversity: None
- Bachelor of Arts: None
- Effective: Spring 2014
- Prerequisite:
IST 885 Introduction to Multisensor Data Fusion (3)
Understanding the concepts, techniques, and issues surrounding the fusion of information from multiple sensors and sources of data.

Rapid advances in nano and micro-scale sensors, ubiquitous wide-band wireless communications and improvements in computing provide the opportunity to collect and disseminate huge amounts of data and information from sensors, humans acting as observers, and emerging data available on the web. Applications for this data are widespread and include areas such as geospatial intelligence, emergency management, environmental monitoring, epidemiology, and others. This course introduces methods and process models for fusion of the information from diverse sources to achieve inferences that cannot be obtained by using a single source or sensor.

Course Objectives:
IST 885 provides an introduction to multisensor information fusion. Multisensor information fusion seeks to combine information from multiple sensors and sources to achieve inferences that are not feasible from a single sensor or source. The proliferation of micro and nano-scale sensors, wireless communication, and ubiquitous computing enables the assembly of information from sensors, models, and human input for a wide variety of applications such as environmental monitoring, crisis management, medical diagnosis, monitoring and control of manufacturing processes. Techniques for fusing multisensor and multi-source information are drawn from a variety of disciplines including statistics, data mining, artificial intelligence, estimation and control theory, pattern recognition, and signal and image processing. While this course is non-mathematical it will help students understand the concepts, techniques and issues associated with developing and using multisensor data fusion systems.

At the end of this course students should be able to:
* Explain different models of multisensor data fusion and describe the advantages and limitations of data fusion
* Explain the five levels of data fusion in the Joint Directors of Laboratories (JDL) data fusion process model
* Assess and characterize a sample information fusion application
* Identify various techniques used in multisensor data fusion and indicate the applicability and limitations of the techniques for a selected application
* Design a data fusion system including specifying the required functions, applicable techniques, selection/assessment of sensors and information sources, and design of a sample user interface
* Discuss current technology trends that affect the implementation of a fusion system.

Student activities:
The course consists of ten lessons and one capstone group project that will span either the 15-week semester or the combined 12-week summer session. Each lesson will require approximately 8 hours of student activity. Student activities will include reading lesson text, online quizzes, and discussions about the way in which multisensor information fusion is applied to selected applications such as geospatial intelligence, environmental monitoring, monitoring of complex systems, crisis management or related areas.

### Information Systems (INFSY)

**INFSY 535 Object-Oriented Design and Program Development in Business (3)** Overview of key concepts in object design and the application of these concepts in business software development.

**INFSY 535 Object-Oriented Design and Program Development in Business (3)**

INFSY 535 will be among the courses making up those prescribed in the MS&IS program and would normally be taken early in the Program. It is a prerequisite to several additional courses that are listed as part of the program. The course is intended to provide students with backgrounds in object-oriented design and to understand the application of these concepts to business problems. Students will learn basic object concepts and develop skills to implement programs utilizing object tools.

As managers in the technology environment, students need to have an understanding of how projects are implemented. To be successful they also need to learn how to work together to design, implement, and manage technology projects.

The goals of INFSY 535 are to:

1) Expose students to principles and concepts within the object oriented programming environment,  
2) Teach students basic principles of project management and to manage a collaborative environment,  
3) Teach students how to apply an object-oriented language in a business environment,  
4) Show students how these techniques increase productivity of complex systems,  
5) Develop team skills when programming complex systems and  
6) Prepare students to continue in the program.

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Fall 2001  
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**INFSY 540 Information Technology and Knowledge Management (3)** Information systems management, enterprise models of information technology, information technology and knowledge management.

**INFSY 540 Information Technology and Knowledge Management (3)**

INFSY 540, Information Technology and Knowledge Management, is a required course for MBA and MSIS students. Students will be provided an understanding of enterprise resource planning and how it relates to information technology architecture and its impact on modern organizations. Students learn Information Technology and Knowledge Management concepts that may be applied to leverage the benefits, avoid the pitfalls, and overcome the limitations of using information technology in an organization.

Although individual assignments and examinations will occur, INFSY 540 includes project- and team-based assignments where students will actively examine Information Technology and Knowledge Management and its effects on industries and specific organizations. Student performance will be evaluated using both individual and team assignments, individual examinations, case study analyses, and research papers.

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Spring 2005  
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**INFSY 543 Electronic Commerce (3)** Overview of key aspects of E-Commerce within an organizational context including coverage of managerial issues and supporting technology.
INFSY 543 Introduction to E-Commerce (3)

INFSY 543 provides a survey of E-Commerce topics, and serves as a foundation for further courses on E-commerce. The course is designed to appeal to both MBA and MSIS students. Upon successful completion of this course, the student will have an understanding of the various types of e-commerce, systems used to support e-commerce, applications of e-commerce, and associated managerial issues. INF SY 543 is an elective in the MBA and MSIS programs. INFSY 540, Information Resources in Management, is a required course for MBA and MSIS students and is a prerequisite for INFSY 543. In INFSY 543, students will continue to explore the interrelationship between technology and organizational performance. Although individual assignments and examinations will occur, INFSY 543 includes project- and team-based assignments where students will actively examine e-commerce and its effects on industries and specific organizations.

Student performance will be evaluated using both individual and team assignments, individual examinations, case study analyses, and c-commerce project(s). INFSY 543 will be offered once per academic year or more frequently, based on student enrollment and demand.

General Education: None

Bachelor of Arts: None
Effective: Spring 2004
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 544 Design, Development, and Management of E-Business (3) Advanced topics in e-business including effective design, development, and management of E-business.

INFSY 544 Design, Development, and Management of E-Business (3)

INFSY 544 provides an advanced exploration of the various options available to construct E-business sites. The course will cover effective design, development, and management of E-business. Issues associated with website layout, user interface design, content management, and web project management will be covered as part of this course.

The course is designed to appeal to both MBA and MSIS students. Upon successful completion of this course, the student will have an understanding of advanced e-business technical and business issues, business models and web-site development.

INFSY 544 is an elective in the MBA, MBA E-business track, and MSIS programs. Students will extend their knowledge from INFSY 543 and continue to explore the inter-relationship between technology and organizational performance.

Although individual assignments and examinations will occur, INFSY 544 includes projects- and team-based assignments where students will actively examine e-business and its effects on industries and specific organizations. Student performance will be evaluated using both individual and team assignments, individual examinations, case study analyses, and e-business project(s).

INFSY 544 will be offered once per academic year or more frequently, based on student enrollment and demand.

Bachelor of Arts: None
Effective: Summer 2004
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 545 Program, Data, and File Structures (3) Program, data, and file structures are studied as they relate to management of data in information systems.

INFSY 545 Program, Data and File Structures (3)

Program, data, and file structures are studied as they relate to management of data used in information systems. This course emphasizes the analysis, design and application of algorithms as they relate to the structure of data. Students will study the underlying concepts of abstract data types, program design, and learn how to analyze systems to better support the software environment. Implementation of the structures studies will be an integral part of the course. Individual projects as well as team exercises are integrated to support the learning process.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 547 WEB Enabled Technologies (3) Integrating design principles and applying technologies that support business related, web-based applications.
INFSY 547 WEB Enabled Technologies (3)
The objectives of this course are to:

- a) teach students how to manage large WEB projects
- b) teach students a programming language that is used to create complex business projects
- c) make students aware of research issues that apply to WEB development
- d) strengthen collaborative skills related to project development

To accomplish these goals, students will study project management as applied to WEB applications, participate collaboratively in a business project where they apply management and design skills over the course of the semester. Additionally, the latest research will be explored as it relates to the above.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 554 Master’s Project (3) Development of an original master’s project in the student’s field of interest and preparation of a paper.

INFSY 555 Data Management Systems (3) Concepts and theory of database management systems explored through data modeling and planning techniques.

INFSY 556 Data Warehousing (3) The study of the requirements collection, design, and development of data warehouses.

INFSY 560 Data Communications Systems and Networks (3) Hardware and software concepts relevant to current communications and networking technology. The importance of telecommunications is emphasized.

Data Communications Systems and Networks (3)
INFSY 563 Network Security (3) This is a study of network security concepts, technology and issues. Authentication, privacy and integrity of messages are analyzed.

INFSY 563 is a follow-up course to INFSY 560, Data Communications and Networking. The objective of the course is that students gain an understanding of network security beyond what can be taught in an introductory course. Although the course is designed to appeal primarily to MSIS students, it is expected that the more technically minded MBA will find the course valuable. Upon successful completion of this course, the student will have an in depth understanding of encryption techniques and the use of keys for encryption. Each student will study the appropriate applications to public keys, secret keys, and session keys. They will gain an understanding of the role of certificate authorities and the public key infrastructure. In addition, students will learn about the various architectures available to transmit information securely across the Internet through virtual private networks. Students will be required to complete a research project that synthesizes their knowledge of encryption, keys, and virtual private networks.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2004
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 564 Wireless Networks (3) This course is a study of wireless network standards, technology and applications. Both local and wide area networks are covered.

INFSY 564 is a follow-up course to INFSY 560, Data Communications and Networking. The objective of the course is that students gain an understanding of wireless networks beyond what can be taught in an introductory course. Although the course is designed to appeal primarily to MSIS students, it is expected that the more technically minded MBA will find the course valuable. Upon successful completion of this course, the student will have an in depth understanding of standards and technology and will be able to decide which forms of wireless are appropriate for various applications. The course covers selection of wireless platforms, design methods, potential impairments and methods to evaluate the throughput of the network. Using a wireless lab, the students will be involved in throughput experiments and analysis of errors and the impact of the errors on application throughput. Students will be required to complete a network design that requires synthesis of their knowledge of transmission techniques, equipment location, security concerns and bandwidth requirements.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2004
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 565 Intelligent Systems in Business (3) This course will emphasize the analysis, design, and application of intelligent systems within organizational settings.

INFSY 565 Intelligent Systems in Business (3)

This course emphasizes the analysis, design and application of intelligent systems within organizational settings. Students will study the underlying concepts of intelligent systems such as expert systems and neural networks and learn how these systems support the business environment. A goal of the course is that students learn when and where intelligent systems will benefit an organization.

Students will analyze cases related to intelligent system development, study the issues of knowledge acquisition, and learn about uncertainty in intelligent systems. Actual system applications will be integrated into the course.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
INFSY 566 Data Mining and Knowledge Discovery (3) The study and application of data mining techniques used to mine patterns in large transactional databases.

INFSY 566 Data Mining and Knowledge Discovery (3)

This course deals with the advanced study of intelligent data mining tools that are used to mine patterns in very large databases. The focus is on theoretical, mathematical and statistical foundations of data mining as well as the applications of data mining to various business applications. Students taking this course will learn different data mining techniques that can be used to mine patterns in large corporate and transactional databases, will be capable of developing and applying data mining tools, and will be able to do independent research in data mining area.

Specific topics include the process of and statistical perspectives on knowledge discovery in databases, graphical models for discovering knowledge, inductive logic programming and data mining, discovering informative patterns and data cleaning, fast mining of association rules, inductive and deductive reasoning for data mining, and mathematical foundations of data mining. Data mining applications in finance, direct marketing and medicine will be emphasized.

Several projects and a research paper required.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 570 Software Engineering in the Analysis and Design of Information Systems (3) Software engineering concepts, specifically the analysis and design of structured information systems using computer-aided software engineering (CASE).

Software Engineering in the Analysis and Design of Information Systems (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 575 Seminar in Information Technology Management (3) Examination of selected topics relevant to current and future managerial and organizational issues of information technology.

Seminar in Information Technology Management (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 585 Applications in Medical Informatics (3) Analysis of complex systems specific to the support of healthcare management and delivery applications.

INFSY 585 Applications in Medical Informatics (3)

The need for and uses of computers in healthcare are presented in the context of patient, clinical, and management support. The course analyzes complex systems ranging from decisions support systems, physician order entry to clinical applications. Issues ranging from the design and implementation of such systems, ethical considerations, and security issues will be presented using a problem-based approach. The integration of data bases and warehouses in health related systems is studied as well as techniques used in computer-assisted decision making to solve healthcare problems, physician portals and clinical and managerial applications of artificial intelligence, including expert systems.

INFSY 585 includes project- and team-based assignments where students will actively examine applications and their effects on the industry and public.

The objectives of this course are:

a) To provide students with the foundations of healthcare informatics.
b) To make students aware of the myriad of computer applications used in healthcare today, including administrative systems used for decision making patient care systems, and research based systems.
c) To make students aware of the ethical and security issues in health informatics from the point of view of the user, patient, administrators, and government regulations.
d) To make students aware of the infrastructure necessary to support an enterprise information system for patient care.
e) To strengthen collaborative skills related to project development and management.

The Pennsylvania State University
INFSY 587 Global Information Technology (3) Comprehensive coverage of components, applications, and issues of global information technology management in organizations worldwide.

Global Information Technology (3)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 590 Colloquium (1-3) Continuing seminars that consist of a series of individual lectures by faculty, students, or outside speakers.

Colloquium (1-3)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 595 Internship (1-18) Supervised off-campus, nongroup instruction, including field experience, practicums, or internships. Written and oral critique of activity required.

Internship (1-18)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 596 Individual Studies (1-9) Creative projects, including nonthesis research, that are supervised on an individual basis and which fall outside the scope of formal courses.

Individual Studies (1-9)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INFSY 597 Special Topics (1-9) Formal courses given on a topical or special interest subject which may be offered infrequently; several different topics may be taught in one year or semester.

Special Topics (1-9)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
Instructional Systems (INSYS)

INSYS 415A Systematic Instructional Development (3) Preparation in the use of a nine-step model for systematically analyzing instructional problems and developing validated, practical solutions.

Systematic Instructional Development (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2013

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INSYS 415B Systematic Instructional Development for Teachers (3) Preparation of teachers to use a systematic model to design learning environments for K-12 classrooms.

Systematic Instructional Development for Teachers (3)

Instructional design (ID) is a systematic approach to designing learning environments. As a systematic process, ID can be viewed as a problem solving approach to identifying and addressing a learning gap. Instructional design is guided by a variety of learning and instructional theories, is governed by techniques such as needs assessment, learner analysis, and content analysis, and is constantly evaluated through formative and summative techniques. Instructional design models include five generic steps, analysis, design, development, implementation, and evaluation.

INSYS 415B introduces the instructional design process and then focuses on each step of the model from the perspective of the classroom teacher. It prepares teachers to use the instructional design process for the creation of instructional materials, or to modify, alter, or re-design existing materials when they do not work in a particular context, or with a particular group of students.

Upon completion of INSYS 415B, students will be able to:

* Define instructional design and relate it to curriculum development and other similar activities of teachers.
* Describe the professional associations affiliated with Instructional Design and the appropriate journals read by Instructional Designers and evaluate journals for personal use.
* Define, write, and classify instructional goals and outcomes.
* Write learning objectives for varied instructional goals.
* Analyze learner characteristics.
* Create assessments aligned with goals and objectives.
* Select instructional materials that are aligned with objectives.
* Develop instruction plans and activities that are appropriate for given objectives, tests, and types of students.
* Select media that are appropriate for given instructional activity.
* Synthesize instructional design steps into a systematic model.
* Apply a systematic process for creating new instructional materials.
* Critically analyze the systematic process and compare it to other possible processes (e.g. constructivism, user-design).

A course in the systematic design of instruction is a core requirement in the Instructional Systems Program and therefore a required course for all graduate students in the program. Since INSYS 415B is intended for classroom teachers who are preparing to use the instructional design process to develop technology based instructional materials for implementation in their classrooms, students who wish to prepare for instructional design in a corporate or higher education setting should take INSYS 415A where the activities and examples are geared to the instructional design process in those settings.

NOTE: Students should take either INSYS 415A or INSYS 415B. Students who have completed INSYS 415A should not register for INSYS 415B.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INSYS 597B Learning and Design in Informal Educational Institutions (3) This graduate seminar explores two related concepts: how people learn in informal educational institutions and how to design for learning in informal institutions. Class members will engage in scholarly conversations around frameworks for research and design. Students will apply the course research to a design blueprint for one learning situation in an informal institution in the course's three
assignments. The design work will be informed by conversations with stakeholders, consultation of the research literature, iterative low fidelity prototyping in subgroups, and peer critique of design.

**IBIOS 511 (BMMB 511, VB SC 511) Molecular Immunology (2)** The study of molecular and biochemical events that influence immune responses and define current questions in immunology.

**IBIOS 511 (BMMB 511, V SC 511) Molecular Immunology (2)**

The goals of the course are to integrate the current questions of immunology with other disciplines, in particular cell biology and biochemistry, and to provide training in critical thinking and evaluation of data and experiments. The course will be approximately 2/3 lecture by the instructor and 1/3 student presentations of papers related to the material. In addition, written critical reviews of recently published papers and a short research proposal will be assigned.

By focusing on the mechanisms involved in immunity and disease, this course complements several existing courses on immunology, virology, and biochemistry. The prerequisites of MICRB 410 and B M B 400 assure that the students enrolling in the course have a general understanding of immunology and biochemistry. This course is projected as a requirement for the Molecular Medicine and Immunobiology options in the IBIOS graduate program and is an elective for the Pathobiology and BMMB graduate programs. The course will be offered in the fall semester with an enrollment limit of twenty students.

**IBIOS 530 (VB SC 530) Regulation of Gene Expression by Xenobiotics (3)** The mechanisms by which foreign chemicals alter gene expression and the techniques used to examine this effect are examined.

**IBIOS (VB SC) 530 Regulation of Gene Expression by Xenobiotics (3)**

The goals of the present course are to enhance the students' ability to read, design, implement and discuss studies focusing on how chemicals regulate gene expression. Through the use of current research articles, the students will understand the principles of experimental design. They will learn critical reading skills as well as enhance their own research and problem solving abilities. In addition, an emphasis will be placed on presentation clarity and ability to defend scientific inquiry from peers. Thus students will develop critical communication skills. The grade is determined by presentations (60%) and one oral assignment (40%). Each student will give several presentations during the semester (depending on the number of students enrolled), each based on a current journal article. All students are expected to read the article and participate in in-class discussions. The oral assignment consists of a series of discussion questions, which the student will answer in writing and "defend" in an informal oral presentation. In addition to being a required course in the Molecular Toxicology graduate program (IBIOS), Regulation of Gene Expression by Xenobiotics will complement several life science graduate programs. This course builds upon Molecular and Cellular Toxicology and requires a good understanding of biochemistry and molecular biology.
IBIOS 532 (VB SC 532) Developmental and Reproductive Toxicology (3) Effects of environmental chemicals, nutrients and drugs on embryo/fetal development and maternal/paternal toxicity.

IBIOS 541 Critical Analysis of Bioinformatics and Genomics Research Topics (1 per semester/maximum of 2) A weekly review of current literature related to the area of bioinformatics and genomics research.

IBIOS 541 Critical Analysis of Bioinformatics and Genomics Research Topics (1 per semester/maximum of 2)

Critical Analysis of Bioinformatics and Genomics Research Topics reviews the recent developments made in the understanding of basic genomics and bioinformatics research. This approach provides an insight into the topics that are shaping the current and future directions in a field that is rapidly evolving and literally transforming lives. Tutorials provide a comprehensive overview of the new and fundamental developments in genomics research and highlight the way in which genomic concepts are applied to basic biological processes. This course will provide insights into computational, evolutionary, and functional aspects of genomic sciences. Basic concepts that describe how life was organized and evolved and applications that promise huge advances in biomedical and biotechnological fields will be discussed. In addition to helping students develop critical oral and written presentation skills, this course is intended to kindle excitement about genomic research among graduate students and provide an intellectual framework for identifying potentially challenging and interesting questions that may be pursued.

IBIOS (BMMB) 551 Genomics (3) Structure and function of genomes including use of some current web-based tools and resources for studies and research in genomics.

IBIOS (BMMB) 551 Genomics (3)

IBIOS/BMMB 551 will deal with the structure and function of genomes including the use of some current web-based tools and resources for studies and research in genomics. The overall objective is to learn current information about the structure and function of genomes, to develop facility in the many web-based tools and resources for further studies and research in genomics, and to appreciate the power and limitations of current resources and knowledge. This course is designed as a basic course for any student in the life sciences who needs to exploit the developments and tools in genomics in their own research and who wants to broaden their understanding of the current knowledge and research in the life sciences that are increasingly drawing on genomics advances. The course will be taught by a team of faculty (members active in genomics research and will be video-conferenced. Students’ grades will be based on take home exams or assignments that require their understanding of the concepts in genomics and the hands-on use of web-based analysis tools, as well as on class discussion participation. Students will be assigned one or more projects, tutorials, problem sets or essays to complete. Reading assignments will further help students explore the materials, do the assignments and participate in classroom discussions.

IBIOS (BMMB) 554 Foundations in Data Driven Life Sciences (3) Expanded overview of current developments and technique in computational biology and genomics.

IBIOS (BMMB) 554 Foundations in Data Driven Life Sciences (3)

The successful progression of data-driven biomedical research is obscured by a wide-range of logistical problems related to data handling and processing, a widespread disconnect between developers and consumers of biomedical analysis software, and lack of accessible, well-developed curricula and active learning opportunities necessary for the development
This course aims to fill these gaps. Topics include fundamental concepts that underpin analysis of sequence data, design of complex experiments, research transparency and reproducibility, as well as result disseminations practices relevant to presentations and publications.

IBIOS 580 Critical Reading in Immunobiology (1)

This course will involve the review of primary literature in topics including immune development and regulation, the phenotype and function of immune cell subsets, autoimmunity, immunodeficiency and the response to bacterial, viral and protozoal pathogens. The major emphasis will be on the critical review of current literature on each subject following an introductory lecture with a view of both broadening the scope of familiarity with immunological topics and to developing the skill of the analytical review of primary literature. Examples of topics to be included are: Natural Killer Cell Biology, Phagocytosis in the Immune System, Biology of Polymorphonuclear Granulocytes, Pattern Recognition Molecules, Mechanisms of Cell-mediated Cytotoxicity, Innate Inflammatory Mediators, Modulation of T cell Function by Antibody, Chemotaxis in the Immune System, Intestinal Immunity, Lung Immunity and Immunity to Intracellular Bacteria. These topics covered in this course will complement, but not overlap with, the topics covered in MICRO 554 and MICRO 560. Topics covered are flexible allowing for change as interests and emphasis in the field shift.

**IMBA 516 Organizational Behavior and Performance (2)**

Analysis of conceptual models, systems, and decision processes consistent with high levels of individual, group, and organizational performance.

**IMBA 516 Organizational Performance Management (2)**

The primary objective of this course is to provide an introduction to the research and case study findings relating to the performance of people and groups in organizations. These findings, when taken in the context of contemporary social, ethical, and legal contextual factors, are employed by managers at all levels of high performing organizations to establish, direct, enhance, and deploy desired behavior of individuals, groups, and the organization itself. Course topics will also focus upon mechanisms for continuous system improvement methods such as employee involvement, training, satisfaction, and well-being. Information regarding work system effectiveness, as well as effectiveness of measurement, control, and support systems is also considered.

**IMBA 517 Corporate Governance (2)**

Study of interrelationships among shareholders, boards of directors, and managers (owner agents) and other stakeholders in a modern public corporation.

**IMBA 517 Corporate Governance (2)**

The subject matter of corporate governance deals with the nature of the interrelationships among shareholders (owners), boards of directors (representatives of the owners), and managers (agents of the owners). These interrelationships form the basis for the modern corporation. As their agents, managers are supposed to run a company in the interest of its shareholders; the board of directors is expected to monitor the performance of managers and to ensure that they do not stray from their primary obligation to the owners. The subject of corporate governance also encompasses the study of corporations’ relationships with its employees, creditors, supplies, and customers. Finally, as corporations are expected to be good citizens of their communities, corporate governance also extends to the study of corporations’ relationships with their communities.

Periodic scandals involving major, publicly held companies have underscored the fundamental importance of these relationships. The larger interests of society and of its citizens require that various stakeholders perform their roles in an ethical manner. This course reviews major theories of ethical and moral development, provides cases and exercises to heighten students’ awareness of these areas, and reviews heuristics and decisions-models for ethical conduct. This course thus also addresses the emerging area of ethical corporate governance, specifically exploring the how ethical conduct and the ethical underpinnings of corporate governance function to safeguard the interests of all stakeholders.

IMBA 523 Organizational Development, Intervention and Change (2) Analysis and assessment of conceptual models, systems, and decision processes for organizational development, intervention and change; transformation and reengineering processes.

Organizational Development, Intervention and Change (2)

This course will analyze organizational models using current theory and case study application to discuss the topics surrounding organizational development, intervention and change. The course focuses on the human and social aspects of the organization as a way to improve the "fit" between individuals and the organization and between the organization and the environment. This analysis and assessment helps to improve the organization's overall performance and stakeholder satisfaction. The course emphasizes the use of Organization Development (OD) as one of the most effective approaches to introduce changes to organizations and to facilitate intervention. The course elaborates on knowledge and techniques from the behavioral sciences to create a learning environment through increased trust, open confrontation of problems, employee empowerment and participation, knowledge and information sharing, the design of meaningful work, cooperation and collaboration between groups and the full use of human potential.

Marketing in a Global Environment (3)

General Education: None  
Diversity: None
IMBA 531 Project Management (2) A problem-based, interdisciplinary course in project management skills and techniques needed to manage projects in a modern business environment.

Project management has been labeled by Fortune Magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, to respond to rapid time-to-market demands. This course would give business majors a competitive advantage in the job market, as companies are in great need of a trained cadre of qualified project managers who can allow the business firm to operate to its highest potential.

The role of the instructor in this course is to train students in the wide variety of demands and skills for which they must be qualified: the ability to exert leadership in managing project teams, an understanding of people and behavioral skills, and the ability to effectively use computer-based scheduling and tracking software to keep to timetables and schedules.

The course will involve semester-long projects, either developed by the instructor or developed (in collaboration with the instructor) by students involved in business enterprises. As a result, students would have real-time experience in the challenges of creating a unified team, solving problems, tracking their projects, and presenting a final paper and presentation on the process.

Accounting for Internal Decision Making (2) Covers basic concepts, issues, tools, and techniques in the use of accounting information for internal decision making.

Managing Human Resources (3) Processes and issues related to staffing and retaining human resources.

IMBA 562 Global Business Management (3) Establishing and expanding businesses in global markets and managing multinational firm strategies and operations.

IMBA 562 Global Business Management (3)

This course examines the unique opportunities and problems that confront multinational companies and international managers as they navigate the company through the extreme complex and ever-changing global economic, political-legal, socio-cultural, and technological environments. It studies the decision choices of international managers regarding business strategies for production and marketing of product and services, the modes of entry into foreign markets, the management of such functions as physical and human resources, production of goods and services, financial management, controlling of operations, labor relations, and conducting businesses ethically. It is designed to help students to gain insights into the complexities of managing across borders and cultures.

**INTAF 597B** Introduction to Research Design (3) This course provides an accessible approach to developing the research, empirical and analysis skills necessary for International Affairs careers and research. The approach is hands-on, with a focus on providing practical skills for evaluating real-world arguments and policies. The course has three objectives. First, to provide a background that prepares students for the required Multi-Sector and Quantitative Analysis (INTAF 803) core courses by giving them a solid foundation in research design and analysis. Second, to familiarize students with a variety of International Affairs methods (e.g. experiments, social networks, and data sources) not covered in other core-classes. Third, to provide law and other students sufficient knowledge of social science approaches to participate effectively in SIA courses.

INTAF 810 Energy, International Security, and the Global Economy (3) This course explores the economic, political, and strategic implications of ongoing trends in global energy markets, particularly oil and gas markets.

This course explores the economic, political, and strategic implications of ongoing trends and structural shifts in global energy markets. It focuses especially on international markets for crude oil and natural gas; attention is also devoted to nuclear energy, the international nuclear industry, and nonproliferation challenges.

Students will develop a deep appreciation of the role of energy, and especially hydrocarbon-based energy, in contemporary international affairs. They will learn about the historical development and evolution of hydrocarbon-based energy and the international oil and gas industry; about the various types of contractual arrangements for cross-border investment in upstream oil and gas development and what the differences among these types of agreements reflect regarding the shifting balance of power between resource-owning national governments and foreign investors; and about why and how major energy market players shape their interactions on the basis of political and strategic calculations, along with commercial and economic considerations. They will also learn about the economic and political factors affecting the contribution of nuclear energy to the global energy balance; about the major proliferation risks associated with civil nuclear technology; and about the international regime that has been developed to mitigate these risks and the most pressing challenges to this regime.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

INTAF 811 Estimative Analysis in International Strategy (3) Analytical methods to estimate future conditions as they might influence international policy, negotiations, or strategic planning.

**INTAF 814** U.S. Policy in the Middle East (3) This course focuses on the strategic challenges facing U.S. policymakers in one of the world's economically, politically, and strategically most important regions.

**INTAF 814 U.S. Policy in the Middle East (3)**

This course explores the strategic challenges facing U.S. policymakers in the Middle East, one of the world's economically, politically, and strategically most important regions. It draws on readings and class discussion to help students develop both a sense of the historical evolution of U.S. policy toward the Middle East and an analytic framework for understanding current policy debates. Students will develop a deep appreciation of the impact of U.S. engagement in the Middle East on modern international history and contemporary international affairs. They will learn about the Middle East's place in the United States' post-World War II and post-Cold War grand strategy, about America's decades-long quest for strategic primacy in the region, and about competing visions among American elites for the exercise of that primacy. They will examine the key bilateral relationships (with Saudi Arabia, Israel, and—since 1979—Egypt) that have shaped U.S. foreign policy toward the Middle East. They will also explore America's long struggle with Saddam Hussein's Iraq and evaluate the U.S. project to build a post-Saddam Iraq that would help consolidate America's post-Cold War dominance in the region. Against this backdrop, students will also learn about major indigenous challenges to American hegemony in the Middle East—e.g., the Islamic Republic of Iran, Islamist resistance movements, and rising demand for participatory Islamist governance among regional publics—and assess U.S. approaches to dealing with these challenges. Students will consider alternative perspectives on jihadi extremism and whether America's self-declared “war on terror” has been self-defeating. Likewise, they will examine America's response to the Arab Awakening, with a particular focus on U.S. military interventions in Libya and (indirectly) in Syria, and Turkey's evolving role in the region. Finally, they will look at Russia's resurgence in Middle East affairs and at the impact of China's deepening engagement in the Middle East and the prospects for Sino-American competition for influence there.

IB 404 Contemporary Issues in International Business (3) Investigation of issues in international business practice interpreted from the foundations of the social sciences. Topics will be chosen from contemporary issues in global business and economics.

IB 404 Contemporary Issues in International Business (3)
IB 404 enables students to study the most current topics in international and global business from the framework of the social science issues that form the framework for understanding, business decisions. The course provides structured experiences in library research and data gathering, techniques, and builds the habit of reading the international business press daily and analyzing it weekly. The class is typically organized around 3 integrative business topics that represent a spectrum of questions important to business. These include questions about finance and economics in international business, questions about people and organizations in an international environment, and questions about products (development, production, distribution of goods and services) in international business contexts. This is not an introductory course, and as such, the topics chosen should be substantive and nuanced. For example, one topic might be how the structure of franchises must be modified to reflect the property rights in a particular country, and how those property rights laws impact the value of the franchise. The second topic might be how the internationalization of the structure and role of Boards of Directors in multinational firms contribute to globalization, and challenge the cultural norms in those organizations The third topic might be how North American firms have been forced to adjust their product packaging, in response to environmental impact laws in Germany, and how this shifts the locus of the product message from point-of-purchase to alternative media.

IB 440 (US;IL) (PL SC 440, AFR 440) Globalization and Its Implications (3) This course explores the socioeconomic implications of globalization.

IB (AAA S/PL SC) 440 Globalization and Its Implications (3) (US;IL)
( BA) This course meets the Bachelor of Arts degree requirements.
This course explores the socioeconomic implications of globalization and some fundamental changes that have taken place in the global socioeconomic system. The bipolar configuration of global power has been radically altered, market-state relations have been reformulated, and global systems of production and finance have been reorganized. Given these recent changes in the world’s structure, globalization as a socioeconomic force is examined with a special emphasis on its implications on social issues, capital-labor relations, the roles of unions and trans-nationals, unemployment issues, poverty and inequality, gender and ethnicity issues, race relations, and democratization around the world. This course also allows students to explore how different countries, communities, social classes, business firms and even institutions are affected differently by globalization. The implications of globalization on Africana communities is given special attention.

The course is organized into three parts: A) The first part of the course attempts to define globalization and identify its essential characteristics in light of social and economic change. This part attempts to answer questions such as what constitutes globalization, how do we know if globalization is taking place, and what aspects of it are new. B) The second part of the course attempts to assess the implications of the different aspects of globalization (identified in the first part) on many critical social issues, including capital-labor relations, the roles of unions and transnational corporations, problems of unemployment, poverty and inequality, gender, ethnic, and race relations, and democratization. C) The third part of the course examines the implications of globalization to African communities.

This course exposes students to the economic, social, political, and cultural implications of the unfolding global order. It allows them to explore how different countries, communities, social classes, business firms and even institutions are affected differently by globalization. Evaluation will be based on daily attendance, along with a class presentation of a design of a research paper; an actual research paper, a mid-term exam and a final exam.

**I B 450 The Business Environment of Europe (3)**

This course provides an overview of the economic, institutional, and regulatory environment in Europe at the EU and national levels.

**I B 450 The Business Environment of Europe (3)**

This course provides an overview of the business, economic, and regulatory environment in Europe at the European Union (EU) and national levels. The course examines how regional integration, through the EU, has shaped industrial, competition, monetary, and related economic policies, and how Europe’s international trade and finance capabilities affect the global economy. As a result, a significant part of the course focuses on the evolution of the EU, its institutional structure, and its impact on business (both European and foreign). The course also compares business-government relations, models of capitalism, and corporate governance in individual European countries, using the United States as a basis of comparison. Particular attention is given to France, Germany, Ireland, and the United Kingdom, and how their business environments differ from each other.

While the primary focus of this seminar will be on these themes, we will use articles from the *Financial Times* and similar publications as the basis of discussion in each class for a range of topics related to Europe. The approach taken in this course is a multidisciplinary one, with the assumption that business executives must understand the political, cultural, institutional, historical, and geographic aspects of Europe if they are to be successful in the business environment of Europe.

Students are expected to be active participants in class discussion. Readings usually will include a textbook, readings packet, and a subscription to the *Financial Times*. Evaluation will be based on a combination of participation and attendance, exams, quizzes, a group project, and essay assignments.

International & Comp Law (INTER)

INTER 950 International Air and Space Law (2) This course will examine with an international perspective the legal status of national air space and outer space and the legal problems surrounding man's activities in these environments. The law governing international and domestic air transport will be surveyed, and the course will conclude with a look at law on the "high frontier."

International Air and Space Law (2)
**INTER 951 Introduction to Transnational Law and Legal Issues (3)**

This course will introduce the student to the nature of transnational law and to issues that lawyers will confront when legal issues transcend national borders. The course commences with an examination of the legal complexities of interactions (including economic transactions, civil litigation, and movement of people) in which national law, international law and private law may all simultaneously play a part. It examines the way in which private law, national law and international play a role in a number of different sorts of transactions, from simple organizations in regulating private behavior on a global basis.

**INTER 952 Law of the Sea (2)**

This course addresses the public law of the sea (as distinct from admiralty law), covering the principal aspects of that subject as follows: historical overview; freedom of the high seas; nationality of vessels; flag State jurisdiction; baselines; boundaries; boundaries of maritime jurisdiction between adjacent and opposite States; internal waters and ports; territorial sea, contiguous zone, straits, and archipelagic waters; continental shelf; exclusive economic zone; deep seabed; marine pollution, living resources of the high seas, and the settlement of disputes, with particular referent to the Law of the Sea Tribunal (Hamburg). From time to time, as appropriate, the instructor may choose individual areas of the world or individual issues of the law of the sea to analyze in special detail within the main subject areas of the course.

The course aims to offer thorough instruction on the foundations and sources of the law of the sea, the principal types of maritime jurisdiction, the principles of resource management, and approaches to the settlement of maritime disputes.

The general historical introduction and subsequent sections are designed to accentuate problems and issues which enable students to master the foundations of the law of the sea.

Accordingly, students of this course should:
(1) develop a more profound understanding of alternative approaches to legal reasoning and of legal concepts and institutions within the framework of international law;
(2) enhance their skills of legal analysis
(3) develop a greater awareness of concepts of legal science and legal system;
(4) read in some depth on the contemporary relevant principal documents on the law of the sea and appropriate doctrinal writings.

At the end of the course students should:
(1) have a sound grounding in how the law of the sea has developed;
(2) be more demanding of rigorous in formulating and evaluating ideas and propositions;
(3) have a sense of the virtues and limitations of comparison as a method of scientific inquiry in law through the analysis of relevant national legislation;
(4) have a thorough command of the main principles and rules of the law of the sea;
(5) give evidence of an ability to understand the other side of an argument, and better appreciate the strengths of an opposing view;
(6) develop a willingness to question, to prove, to seek further information, and to display initiative in expanding one’s knowledge.

**INTER 953 Law of Treaties (2)**

Treaties are the foundation of public and private international law and national foreign affairs law. This course examines: historical development of law of treaties; concept of treaty; treaty as source of international and national law; stages of concluding treaty; reservations; accession to treaties, functions of depositary; publication of treaties; breach of treaty obligations; invalidity, termination, and suspension of treaties; denunciation and other withdrawal from treaties; treaties and jus cogens; treaties and customary rules of international law; treaties and third States; treaties and municipal law; interpretation of treaties; languages and authentic texts of treaties.

**INTER 953 Law of Treaties (2)**
Treaties are the foundation of public and private international law and national foreign affairs law. This course examines: historical development of law of treaties; concept of treaty; treaty as source of international and national law; stages of concluding treaty; reservations; accession to treaties; functions of depositary; publication of treaties; breach of treaty obligations; invalidity, termination, and suspension of treaties; denunciation and other withdrawal from treaties; treaties and jus cogens; treaties and customary rules of international law; treaties and third States; treaties and municipal law; interpretation of treaties; languages and authentic texts of treaties. Texts: A. Aust, Modern Treaty Law and Practice (Cambridge University Press, 2000); W. E. Butler, The Law of Treaties in Russia and the Commonwealth of Independent States(Cambridge University Press, 2002).

The course aims to offer thorough instruction on the foundations and sources of the law of treaties, the role of treaties as a source of international law, the procedures of treaty-making, the relationship between treaties and customary international law and rules just cogens, and the role of language in treaty-formation.

The general historical introduction and subsequent sections are designed to accentuate problems and issues which enable students to master the foundations of the law of treaties.

Accordingly, students of this course should:
(1) develop a more profound understanding of alternative approaches to legal reasoning and of legal concepts and institutions within the framework of international law;
(2) enhance their skills of legal analysis
(3) develop a greater awareness of concepts of legal science and legal systems;
(4) read in some depth on the contemporary relevant principal documents on the law of treaties and appropriate doctrinal writings.

At the end of the course students should:

INTER 954 Foreign Investment in Russia and the CIS (2) Addresses principal aspects of the legal framework for foreign investment in Russia and other CIS countries.

INTER 954 Foreign Investment in Russia and the CIS (2)
This is a "hands-on" subject which requires students to analyze and negotiate the essential elements of a foreign investment transaction in the Russian Federation, having regard to those elements of Russian law and legal institutions that any foreign investor will have to be familiar with. The course commences with an introduction to the legal foundations of the Soviet State monopoly of foreign trade, an overview of foreign investment laws in the CIS countries, investment guarantees, the investment vehicles of choice in Russia, elements of private international law, the role of legal opinions, and the settlement of commercial disputes, with special emphasis on arbitration. Most of the course is devoted to "negotiating" a draft charter of a joint-stock or limited responsibility society against the background of relevant Russian legislation.

The course aims to offer thorough instruction on the role of the State in foreign investment guarantees, the transaction aspects of foreign corporate vehicles, and the role of arbitration in settling foreign investment disputes.

The general historical introduction and subsequent sections are designed to accentuate problems and issues which enable students to master the framework of foreign investment in Russia and the CIS.

Accordingly, students of this course should:
(1) develop a more profound understanding of alternative approaches to legal reasoning and of legal concepts and institutions within the framework of investment transactions;
(2) enhance their skills of legal analysis
(3) develop a greater awareness of concepts of legal science and legal system;
(4) read in some depth on the contemporary relevant principal legislation and treaties regulating investment in Russia and the CIS and appropriate doctrinal writings.

At the end of the course students should:
(1) have a sound grounding in how the law of regulating the framework of foreign investment in Russia and the CIS has developed;
(2) be more demanding and rigorous in formulating and evaluating ideas and propositions;
(3) have a sense of the virtues and limitations of comparison as a method of scientific inquiry in law through the analysis of relevant national legislation;
(4) have a thorough command of the main principles and rules of law regulating foreign investment transactions;
(5) give evidence of an ability to understand the other side of an argument, and better appreciate the strengths of an
opposing view;
(6) develop a willingness to question, to probe, to seek further information, and to display initiative in expanding one's knowledge.

INTER 958 Comparative Constitutional & Public Law (3) The principal objective of this course is to provide students with a greater understanding of how their country's body of constitutional law is shaped by history, institutions, and current values. The comparative project, by focusing on narrow differences between two very similar countries, allows students to move beyond an acceptance of basic premises of constitutional law as "natural" or "inherent." As an important dividend, students will gain basic knowledge of foundational concepts in the legal landscape of their country's largest trading partner, hopefully providing students with a comparative advantage in seeking employment with government offices and private firms whose clients engage in substantial cross-border transactions.

INTER 959 Russian Law (2) This 2-credit course is concerned with the development of the law, legal system, and legal institutions of what is popularly known as Russia but also correctly and officially known as the Russian Federation within the boundaries presently occupied and, historically, within the boundaries of the Russian Empire. By "law" we mean formal legislation, customary rules, relevant international legal rules, legal doctrine, and anything else regarded by the Russian State or by Russian jurists as comprising part of the "law." For our purposes "legal institutions" encompass all law enforcement agencies or any other agencies of the State or empowered by the state which are concerned with the law in any manner whatsoever, including educational institutions.

INTER 968 Comparative Antitrust Law (3) This course focuses on the antitrust law of the European Union and selected other jurisdictions. It will cover international mergers, monopolies, price fixing cartels, distribution restraints, and related topics. The course examines principles of comity and cooperation among international enforcers investigating cases with a multi-national impact. We also review the antitrust laws of other selected jurisdictions, focusing on proposed and recently enacted competition laws including those of selected new entrants to the European Union and China, and on laws of other jurisdictions with an important impact on U.S. firms such as Japan. Finally, the course will consider issues such as advising multi-nationals, obtaining discovery internationally, and litigating complex cases.

INTER 969 International Organizations (2) International organizations play an influential role in the world today. Just a few of the fields they address are peacemaking and peacekeeping, labor relations, food production and distribution, education, health, economic development, monetary affairs, international trade, civil aviation, tele-communications, protection of intellectual property and nuclear energy. This course will examine lawmaking and regulation by international organizations, the regulatory impact of governance by these organizations, issues of legal personality, membership, participation, rights of members and termination of membership, as well as enforcement and dispute settlement. Focus will be on the United Nations and its specialized agencies, including the World Health Organization, the Food and Agriculture Organization, UNESCO and the International Labor Organization.

**INTER 974 Civil Law From Empire to Union (3)** The most important issue of Civil Law today is its Worldview and its perspectives on Citizenship as well as on International Justice. In other words, particularities of the Civil Law sustain a worldview that stems from Roman Law-traditions and practices of the Roman Empire. These pertain to more recent legal developments taking place in a unifying Europe. The profiles of the major functionaries in today's Civil Law domain: judges, attorneys, EU civil servants and administrators mirror such traditions. This course is not restricted to a traditional comparative perspective. Means are provided for a correct and effective transnational communication between legal professionals. To study Civil Law and EU Law implies an approach, understanding and management of the electronic means to communicate with its citizens, institutions and courts. The EU website is an outstanding instrument to understand the structures within lawyers must operate.

IT 475 Modern Italian Literature and Cinema (3) Focus on silent films, fascism, WWII, Resistance, Neorealism, and reactions against Neorealism.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IT 475 Modern Italian Literature and Cinema (3)

(BA) This course meets the Bachelor of Arts degree requirements.

This course will explore the literary, cultural, and historical backdrops behind a variety of films from Fellini's The Road, to one of the greatest spaghetti westerns ever made (Leone's Once Upon a Time in the West), to the Oscar winner for Best Foreign Film (Benigni's Life is Beautiful). Selected 19th and 20th-century prose texts also trace such issues as the individual's role in society and the use of the imagination in the representation of history. This course aims to provide students with the fundamental tools to read texts and watch films critically and intelligently while presenting an overview of some major themes of Italian culture. Students will be evaluated on three in-class exams, paper outline, final paper, and participation in class discussions/activities/debates. IT 475 is the first interdisciplinary course taught in English at the IT 400 level. The course helps satisfy the Italian minor requirement. It is also good for students who have taken IT 130 and want to know more about 20th-century Italian lit/film/culture without having to do course work in Italian. IT 475 may also be of particular interest to students of film and media studies, English or comparative literature, religious studies, and history. This course satisfies the Italian minor or bachelor of arts humanities requirements. IT 475 will be offered once a year with 40 seats per offering.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IT 480 Italian Women Writers Through the Centuries (3) Analysis of the works of women authors in their historical and literary contexts.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IT 480 Italian Women Writers Through the Centuries (3)

Italian women have been stereotyped as the "mamma" or grandmother who cooks, prays, and idolizes her sons. Such an image does not accommodate the wide variety of experiences, perspectives, and contributions of Italian women throughout history. This seminar will explore the writings of female authors from delimited historical periods (alternating among Renaissance, 19th and 20th Centuries). Depending on time period, genres will include autobiography, poetry, historical novel, drama, film, nonfiction. Throughout the course we will consider the political and social developments in Italy with an emphasis on issues of special relevance to women. As we approach each text, we will examine such questions as: the significance of its form; the author's use of language; the ways in which masculinity and femininity are constructed; intersections with the text's historical moment; the political, philosophical and/or theological questions posed by the text; the ways in which the text inserts or distances itself from the Italian literary canon; and the text's depictions, re-evaluations and uses of history. Through their journal assignments in class discussion, students will be encouraged to reflect upon the implications of course concepts in their own culture and historical moment. Evaluation methods include participation in class discussion, journal entries, short analysis papers, and a longer (8-10 page) research paper. In Italian. Prerequisite: any 300-level Italian course. This course is conducted in Italian and counts for the Italian major and minor. The ability to screen VHS and DVD videos is necessary. Enrollment is limited to 20, and the course will be offered at least once every four semesters.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

IT 485 Italian-American Cultural Studies (3) In-depth exploration of Italian-American cultural contributions.

IT 485 Italian-American Cultural Studies (3)

Italian-American Cultural Studies explores the representation of self-representation of Italian-Americans that have been produced over the past century in a variety of aesthetic forms. Through analysis of literary and cinematic works, informed by readings in history and sociology, students will refine their critical reading and writing skills, come to a deeper understanding of important currents in 20th-century American history, gain a more informed appreciation of the contributions of Italian-Americans to the arts, engage critically with concepts such as "identity," "ethnicity," "gender," and "heritage." This course fulfills requirements for the major and minor in Italian, and allows students interested in Italian-American culture to undertake more in-depth and specialized study than is possible in the 100-level General Education survey offered by the department in English. Evaluation methods include participation in class discussion, short
analysis papers, and a longer (8-10 page) research paper. The ability to screen VHS and DVD videos is necessary.

JAPNS 402 (IL) Level Three Japanese B (4) Exclusively for study abroad returnees. To further develop Japanese proficiency in speaking, listening, reading, and writing.

JAPNS 402 Advanced Reading (3) (IL)

This course meets the Bachelor of Arts degree requirements.

This class is offered exclusively to students who have studied abroad in Japan. Only primary multimedia sources (i.e., not a text book) will serve as course materials. Five classes a week will consist of reading session, multimedia presentation, and high level discussion. Intensive analysis and class discussion of multimedia materials will provide the student the opportunity to develop advanced ability to understand, construct, and express opinions and complex verbal concepts in appropriate contextual forms/modes.

JAPNS 403Y (IL) Level Four Japanese A (4) Continuation of JAPNS 402. Aims to improve students' proficiency in all four language skills, with a special emphasis on writing.

JAPNS 403Y Level Four Japanese A (4) (IL)

This is a four credit course designed for those who have completed Level Three Japanese B or the equivalent. The course aims to further develop students' proficiency in all four language skills, with a special emphasis on writing. Students will study several topics such as Japanese society and Japanese literature for content-based language learning throughout the semester. For each topic variety of media will be used—newspaper articles, essays, short stories, TV programs, movies, etc. The majority of reading and writing assignments will be done outside class, with some guidance from the instructor. That will help students become more independent in studying Japanese. They will use appropriate resources such as dictionaries, reference books, online dictionaries and other online resources depending on their individual needs. Class time will be used mainly for discussions of content, feedback on writing, and presentations by students. All class activities will be conducted in Japanese.

Writing exercises include short response papers on topics and summaries of literary pieces or audio visual materials. In the response papers students will reflect more deeply on certain topics, synthesize information from course materials, express their opinions, and support ideas by referring to and citing from source texts. This will help students be prepared for a longer thesis in the next course in the sequence. Discussion on the summaries will cultivate sensitivity toward words and expressions.

The course will help students start building their career in Japanese. Students will familiarize themselves with and if they wish study for the Japanese Language Proficiency Test (Level N2). They will also write a resume and formal letters that could be used in job applications and practice formal spoken communication in business settings.

JAPNS 410 (IL) Japanese Through Manga (3) This course aims to expand students' knowledge and application of Japanese language beyond elementary and intermediate textbooks through the use of manga (graphic novels).

JAPNS 410 Japanese Through Manga (3) (IL)

(BA) This course meets the Bachelor of Arts degree requirements.

This course is a three credit course designed for those who wish to expand their knowledge in Japanese and application of it beyond typical elementary and intermediate textbooks. The course will use manga, the format of which helps students understand the story line, the setting, and the thoughts and emotions of the main characters. Given quick interactions between manga characters and onomatopoeia that accompany pictures, students will learn natural daily communications of Japanese. Class discussions will also cover relevant customs, manners, cultural values, socio-historical context, and social perspectives along with language use. The exact texts will vary from instructor to instructor, and may include film and new media in addition to a primary focus on manga.

The course will serve as a gateway to the further exploration of Japanese authentic texts and audio visual materials.

The prerequisite is JAPNS 110. Students who have successfully completed JAPNS 110, JAPNS 401, or JAPNS 402 are encouraged to take the course. Students who have finished JAPNS 403Y or JAPNS 404 may also take the course.

JAPNS 421 (IL) Courtly Japan (3) Focused study of aristocratic society and culture of Heian period Japan.

JAPNS 421 Courtly Japan (3) (IL)

(BA) This course meets the Bachelor of Arts degree requirements.

The Heian period of Japanese history saw the apex of a refined court culture. Through readings of primary and secondary sources, this seminar-style course will explore the activities, norms, and structures of courtly society in Japan, from the centralization of imperial power in the 8th century through the court’s political marginalization in the late 12th century. We will pay particular attention to religion, the arts, politics and governances, gender, and the gradual rise of samurai power in the shadows of the court.

This course is intended to provide an introduction to the political, social, economic, and cultural life of the Heian court of ancient Japan. The goals of the class are not only to gain an understanding of a time and place far removed from our own, but also to develop the skill of building such an understanding through primary and secondary sources, both written and visual. Students in this class will take on the role of historian or literary critic themselves, thinking critically about assigned texts and making their own interpretations of their meanings. Through readings, discussions, presentations, and the final project, students will enhance their ability to think critically and to express their ideas clearly in both speech and writing.

Class work includes some lecture but emphasizes guided discussions, group work, writing exercises, and some student presentations. This participatory approach is intended to deepen student’s appreciation of the assigned readings, to help them understand value systems that may differ from those predominant in western cultures, and to assist students in developing both analytic and expressive abilities. The details of evaluation will vary depending on the instructor. In general, the emphasis will be on student performance on a day-to-day basis and as expressed in a final research project.

The course is designed to be suitable for all students generally interested in Japan, or interested in various fields of humanistic study. This course is recommended, but not required, of the Japanese major. It is designed to count as a B.A.

JAPNS 422 (IL) War and the Warrior in Japan (3) Survey of the role of warfare and the warrior in Japan, with attention to changing cultural settings. Taught in English.

JAPNS 422 War and the Warrior in Japan (3)  
(IL)

This course is intended to provide an introduction to the social and historical roles of warfare, and the changing cultural figure of the warrior, in Japan. Some prior study of Japan (JAPNS 120 or JAPNS 121 or HIST 172) is required. All materials will be available in English. Students will learn about subjects like the causes of violence, culturally acceptable ways of resolving conflict, obligations of victor toward vanquished, expectations regarding the memory of the war dead, the ideal of the warrior as a cultural figure, and historical roles that Japanese warriors have played in ages of peace. Readings and screenings will cover several genres, such as film, historiography, history, documentary, classical epic, modern novel, and excerpts from Japanese history textbooks (in translation). The course, or individual units within the course, will be structured so that students develop an historical perspective, allowing them to understand the cultural contexts that have generated attitudes toward war and the warrior in Japan. In addition, students will learn to think critically about various media’s techniques and aesthetics of representation, and will become more engaged, critical investigators of literature and related media. Readings and in-class discussion will focus on the image of the warrior as a cultural icon, exploring the many ways in which popular understandings of the warrior have changed over time, for instance, as popularized dramas began to idealize warriors as moral exemplars in the late medieval period, and then as historical realities made the position of the warrior itself redundant in the early modern era.

Class work includes some lecture but emphasizes guided discussions, group work, writing exercises, and some student presentations. This participatory approach is intended to deepen students’ appreciation of the works, to help them understand value systems that may differ from those predominant in western cultures, and to assist students in developing both analytical and expressive abilities. Through critical reading, group discussion and interpretive writing, students will hone skills for evaluating modes of cultural production and consumption in premodern and modern Japan. Evaluation will be through means such as in-class presentations, short writing assignments, midterms or quizzes, one analytic paper (3-7 pages), and in-class/on-line participation and discussion.

The course is designed to be suitable for all students generally interested in Japan, or interested in various fields of humanistic study.

JAPNS 423 (IL) Men, Women, and Animals (3) Japanese history and culture through the lens of relations between men and women and between humans and animals.

JAPNS 423 Men, Women, and Animals (3)  
(IL)

Through readings in primary and secondary sources, and to a lesser extent through the evaluation of visual images, this seminar-style course will examine relations between men and women in changing social contexts over time in Japan. We will also investigate human-animal interactions, in the realms of literature and symbolism, religion, and food production and other aspects of economic production. The course will address issues fundamental to every society past and present. Therefore, it will not only deepen students’ knowledge of Japan but it will also provide a solid basis for comparative study of other societies.

The Pennsylvania State University
JAPNS 424 (IL) Traveling Voices (3) Transnational Writings of Japan: from Modern to Contemporary Eras.

(BA) This course meets the Bachelor of Arts degree requirements.

Through literary and visual texts from modern to contemporary eras, this seminar-style course will explore a wide range of narrative voices of Japan, created by writers who are physically or figuratively dispersed in many directions within, towards, and away from Japan, and who therefore problematize “Japanese-ness” by dealing with cultural situations (e.g. identities, marginality) in their writings. Some Prior Study of Japan (JAPNS 120, JAPNS 121, or HIST 172) is required.

Students will explore the rich cultural diversity in Japan and the Japan diaspora, and develop a further understanding of historical border crossers between Japan/East Asia and Americas/the West. They will become more aware of the reciprocal and transformative cross-cultural interactions in languages, literature, religions, economics, ideas, or political formations. They will learn how to think critically, in speech and writing, and develop writing analytic skills appropriate to their final paper project.

Evaluation will depend on specific instructor practice, but will certainly emphasize guided discussions, some student presentations (alone or/and group), and writing exercises (especially final research project). A sample guideline might look like this:

Class Participation/discussion
Response papers
Informal Presentation (pair or group up to three)
Mid-term exam
Final paper presentation
Final Project

JAPNS 426 (HIST 474, ASIA 474) Early Modern Japan (3) Japanese history from 1580 to 1880.

Japan’s Tokugawa period can be difficult to grasp. It resembles a modern society in many respects but operated according to a logic of social organization different from that of most modern states. There was a collective sense of national identity, but its characteristics differed significantly from modern forms of Japanese identity. Moreover, modern ideologies have contributed to the characterization of early modern Japan as a rigid society and of the country as a whole having been isolated from the rest of the world. The main purpose of this course is to afford students the opportunity to study early modern Japan in detail and, insofar as possible, on its own terms.

Through readings in primary and secondary sources, and through the evaluation of visual images, this seminar-style course will deepen students’ knowledge of Japan and serve as basis for comparative study of other early modern societies. Although the course investigates classic areas of historical study such as institutional development and foreign relations, the emphasis is on social and environmental history. The course encourages students to think about a range of approaches to the past and to think about the ways our contemporary biases influence the ways we understand the past.

JAPNS 450 (IL) Introduction to Classical Japanese (3) Basic patterns and structures of Classical Japanese from its development in the 6th century through usage in the 20th century.

This course is an introduction to the basic grammar and stylistic idiosyncrasies of classical Japanese (bungo). Students will be guided through an examination of key syntactical structures and will be asked to apply their knowledge in order to read, translate, and discuss various texts from the classical, medieval, and early modern periods. In addition to gaining familiarity with standard reference materials (such as dictionaries of classical Japanese), students will also gain a working knowledge of the styles and themes of major works of pre-modern Japanese literature. Successful completion of this course will give students the fundamental skills necessary to read texts composed prior to the 1900’s and to engage in research in the field of pre-modern Japanese studies. With this training and knowledge concerning the development of the Japanese language, students will increase their proficiency in modern Japanese and their overall knowledge of Japanese culture and literature.

Prior study of modern Japanese is required (with proficiency equivalent to successful performance in JAPSN 402). The purpose of the course is to make bungo (“literary Japanese”) accessible to as many students as possible. Classical Japanese first appeared in the 6th and 7th centuries and was used to write a wide variety of texts up until the mid-20th century. Knowledge of it is very useful to anyone interested in studying Japanese history, literature, philosophy, politics, art, or culture. The course offers a systematic introduction to the grammar of Classical Japanese, while also presenting Classical Japanese and Modern Japanese as part of a linguistic and cultural continuum.

JAPNS 452 (IL) Contemporary Japan: Cultures, Lifestyles, Trends (3 per semester/maximum of 6) Survey of aspects of modern Japanese society; includes readings from Japanese newspapers, magazines, and fiction; topics may vary each semester.

This course orients students to cultural issues and trends in contemporary Japan, and the way that those issues and trends impact the country's identity and culture.
trends are explored in literature, film, newspapers and magazines. The course examines a selection of Japanese-language materials from an array of genres, modes of representation, and historical settings. Focusing on the postwar era to present (1945-), this course introduces various aspects of contemporary Japanese culture, from literary works of the postwar experience to recent popular culture, including anime (animated movies) and manga (graphic novels). Each work is discussed in terms of its own literary or artistic merit, the social context that produced it, its position within the larger trends of literary development in Japan, and its relevance for the modern reader. This course is designed for (prospective) Japanese major or minor students interested in broadening their knowledge of Japanese culture and society as well as for students who wish to compare other cultures and literatures they have studied with those of Japan.

JAPNS 453 (IL) Japanese Film (3 per semester/maximum of 6) Selected films and directors representing various aspects of Japanese culture and cinema; topics may vary each semester.

JAPNS 454 (IL) Japanese Literature (3 per semester/maximum of 6)

(BA) This course meets the Bachelor of Arts degree requirements.

This class will be a seminar-style study of contemporary Japanese literature. The goal of the course is to help students move from grammar-assisted reading assignments (which may provide vocabulary lists, grammar notes, and cultural notes) to reading 'raw' materials in Japanese, where students are responsible for knowing how to use the appropriate reference materials so that they can compile vocabulary lists, grammar notes, and cultural notes on their own. Students will be reading selected works from an array of genres such as autobiography, poetry, fiction, drama and essays, with topics and thematic focuses varying from semester to semester.

Typical class sessions may involve reading aloud from a literary work; engaging with student presentations (in Japanese) on authors, genres, thematic elements, and relevant historical or cultural events; discussing Japanese literary history; analyzing short passages for their aesthetic qualities; and working with specific items of grammar or vocabulary. Participants will be required to read and discuss Japanese literature in Japanese. Exercises will range from group discussion, web-based research in Japanese and English, presentations, essays and film analysis. Students must prepare for class by reading the material carefully, taking notes, writing down questions, and being ready to take part in lively conversations. Course discussion will take place primarily or exclusively in Japanese. This course satisfies the International Cultures requirement.

J ST 405 (IL) (RL ST 405) Ancient Jewish Traditions and Modern Food Movements (3) Jewish laws, customs and attitudes with regard to food production, agricultural policy and eating from biblical to modern times.

J ST (RL ST) 405 Ancient Jewish Traditions and Modern Food Movements (3) (IL)

This course examines Jewish laws, customs and attitudes with regard to food production, agricultural policy and eating from biblical to modern times. These tenets of the Jewish tradition presently underwrite modern movements concerned with land use and food sustainability, as well as ethical behaviors in food production. The goal of the course is to understand how Jewish tradition can inform and contribute to improvements in the modern food system. The starting point is the ancient world of the Israelites. Students will study agrarian interpretations of the Hebrew Bible as well as extra-biblical sources and archaeological data. The biblical attitudes toward food, eating, and agricultural...
practices are then traced into the post-biblical period and rabbinic periods. The course then jumps ahead to the present day, to shed light on a number of modern Jewish agricultural and food initiatives concerned with issues such as healthy land use, sustainability, and justice in food production and distribution. These movements proceed from various interpretations of Jewish law and custom, and illustrate how some modern Jewish attitudes toward food and eating are responsible for reimagining, and in some cases reinvigorating, biblical ideas and practices.

At the conclusion of this course, students will be able to identify and understand the historical and theological significance of diet and eating practices of ancient Israelites and will understand the development of Jewish food laws and practices in the post-exilic and early rabbinic eras. Students will be able to evaluate the extent to which ancient Jewish thought has influenced modern Jewish attitudes and actions regarding food and social responsibility, and will be able to envision the ways in which Jewish tradition, both ancient and modern, can contribute to current progress and future improvement in our systems of food production, distribution and consumption. While a wide variety of derivative topics will be discussed, this course is particularly appropriate for students pursuing programs of study dealing with the biblical world, the development of early Judaism, Jewish ethics, and/or modern Jewish thought, as well as those studying agriculture and food systems who are interested in how Jewish tradition addresses these universal concerns.

Evaluation will be based on weekly 1-2 page written responses to the assigned readings (45%), a midterm exam (15%), final project (30%), participation (10%). No special facilities are required. Course will be offered each term, enrollment limited to 20 students.

J ST 409Y (IL) (HIST 409Y, RL ST 407Y) European Anti-Semitism from Antiquity to the Present (3) Surveys the history of anti-Semitism in Europe from antiquity through the Middle Ages to the present.

J ST (HIST) 409Y (RL ST 407Y) European Anti-Semitism from Antiquity to the Present (3) (IL)

(BA) This course meets the Bachelor of Arts degree requirements.

This course analyzes major episodes in the history of anti-Semitism and tries to clarify the Motives and dynamics involved. It seeks to understand what these episodes have in common, and what is unique in each case. Is there a single universal, eternal anti-Semitism? Or are there rather anti-Semitism, each belonging to a unique historical context? Is there a single continuous line of development in anti-Semitism? What is the relationship of a particular anti-Semitism to the national culture in which it originates?

We will be reading the major original texts of anti-Semitism from Roman and ancient writers, through early Christian texts and medieval Christian Blood Libels against the Jews, documents of the Spanish expulsion, Lutheran tracts, Voltaire's essays, German philosophical texts from Kant to Marx, Wagner's racial essays, the Protocols of Zion, and documents of Nazi anti-Semitism by Hitler and Streicher.

The major part of the grade will depend on a short research paper which will be presented in various drafts, so that the final version represents the culmination of discussion and constructive criticism and advice. This course is a parallel course to J ST/HIST 416 (Zionist History) and J ST/HIST 118 (Modern Jewish History). This course will count toward the Religious Studies, Jewish Studies, and History majors and minors in the 400-level category. This course is offered once every other year with 25 seats per offering.

J ST 410 (US;IL) (HIST 410, RL ST 410) Jews in the Medieval World (3) Trends in medieval Jewish society under Islam and Western Christendom.

J ST 410 Jews in the Medieval World (3) (US;IL)

The Jews lived in widely scattered communities under Christian and Islamic rule in the medieval period. This course will examine how Jews adapted the traditions they developed in Palestine and Babylonia in the early centuries C.E. to the new conditions they encountered in Europe and the Mediterranean region from the ninth to the fifteenth centuries. It will focus on the general problem of how traditional societies survive in rapidly changing circumstances, particularly when their members are a minority population. The course will aim at developing students' skills in comparative analysis as they compare the adaptive strategies of Jews in different cultural spheres (the Franco-German region versus Spain, for example). They will also be asked to compare the different polemical stances Jews adopted vis-a-vis Christianity, on the one hand, and Islam, on the other. They will be encouraged to understand the ways in which Jews internalized certain aspects of the majority culture and rejected others. It is hoped that they will come to see how deeply Jewish history was
intertwined with medieval Christian and Islamic history, despite inter-religious hostilities and the frequent need for Jews to defend against majority aggression.

Students will be evaluated on the basis of two mid-term exams (the first after the survey of the Muslim world, the second after the examination of the Franco-German region) and a comprehensive final exam.

The course will be linked to most of the courses taught in the field of Jewish Studies, especially J ST 111 (Early Judaism), J ST 114 (Modern Judaism), and J ST 118 (Modern Jewish History from 1492). It will also be linked to offerings in Religious Studies: RL ST 001 (Introduction to World Religions), RL ST 101 (Comparative Religion), RL ST 107 (Introduction to Islam), RL ST 124 (Early and Medieval Christianity), and RL ST 165 (Introduction to Islamic Civilization). Further, it would complement HIST 001 and 002 (The Western Heritage), HIST 107 (Medieval Europe), HIST 108 (The Crusades), HIST 407 (Early Medieval Society) HIST 408 (Church and State in the High Middle Ages), HIST 412 (Intellectual History of the Middle Ages), and HIST 471W (Classical Islamic Civilization, 600-1258).

The course will count for 3 credits toward:

a) the 22 credits required for the minor in Jewish Studies
b) the 33 credits required for the major in Jewish Studies
c) the 30 credits required for the major in Religious Studies
d) the 36 credits required for the History major

It will be offered once a year with an enrollment of approximately 60 students.

**J ST 424H (HIST 424H, RL ST 424H) Monotheism and the Birth of the West (3)**

The birth of monotheism and its relation to social organization, the idea of individuality, and science.

Learn about the formation of Western culture, while learning to analyze the texts and other evidence about its formation from a critical, rather than naive, viewpoint. The idea of monotheism probably arose very early and was even briefly implemented as a state cultic policy in Egypt in the 14th century BCE. Why, then, did it take another seven centuries to become widespread—appearing in ancient Judah, Babylon, and Ionia almost simultaneously? To answer this question, the course focuses on several developments, through the medium of primary texts and archaeology: the shift from a state hinterland based in extensive agriculture and household processing to one organized for intensive agriculture and industrial processing the rise of recognizable modern science; the promotion of individuation and an international elite culture in the context of Assyrian and Babylonian imperial ambitions; the development of the historical and archaeological arts in the context of archaizing in order to reinvent local traditions; and the socialization of monotheism and of democracy. Students will be evaluated on their discussion of the textual evidence as well as on reports in class and a final paper. This is the sole honors course treating the birth of the West. It expands on knowledge acquired in courses listed as prerequisites and in CAMS/J ST/RL ST 012; CAMS 044; ANTH/CAMS 133; CAMS/PHIL 200; HIST 100; HIST/J ST 102; and PHIL 200 and enriches the student experience in CAMS 400, CAMS 440, and CAMS 480; HIST 402; J ST 411; PHIL 437, PHIL 453, and PHIL 461. This course counts toward the major in Jewish Studies, History, and Religious Studies and toward the minor in Jewish Studies and Religious Studies. This course will be offered once every other year with 35 seats per offering.

**J ST (ENGL) 427 Topics in Jewish American Literature (3)**

An in-depth examination of important themes, writers, and/or historical developments in Jewish Literature of the United States.

This course will provide sustained examination of major themes, texts, and figures in the Jewish American literary tradition. The course will focus on depth rather than breadth in its analysis of the defining aspects of the literature and on what the literature reveals about Jewish American culture and identity. The United States has absorbed large numbers of Jewish immigrants from many parts of the world, holding many different ideas about Jewish practice, and affiliating themselves with many different political, social, and cultural traditions, and moreover Jews have settled and made homes in a wide variety of American communities. Close analysis of literature will therefore provide an opportunity to consider the constitution, origin, and development of Jewish America's wider cultural, political, and social contexts. Materials will consist predominantly of primary texts, including prose fiction and nonfiction, poetry, drama, and film, and the methodology will emphasize the close reading of these texts. The course complements offerings in Jewish Studies, English, and Comparative Literature. Most obviously, the course will offer students of Jewish literature, world literature, and American literature an opportunity for contextualization. It enables students in Jewish Studies to study the rich literature of American Jews, and it adds to courses covering Jewish American history, religion, and culture. The course offers students in English and Comparative Literature a valuable, sustained introduction to an important U.S. and world sub-culture and -literature.

J ST 433 Introduction to Jewish Music and Art (3) Introduction to the study of Jewish music and art from antiquity to the present.

J ST 433 Introduction to Jewish Music and Art (3)
The course will provide an introduction to the importance of art (including architecture) and music to Jewish civilization from the ancient world to the present. The course stresses the way in which Jews have adapted techniques from the peoples around them, and how their art and music have developed under circumstances ranging from almost complete toleration to extreme persecution. Important periods covered including synagogue art and architecture from late antiquity to the Middle Ages; illuminated manuscripts, decorative arts, and songs from the Middle Ages; the emergence of important professional Jewish artists and musicians in the nineteenth century in Europe; Jewish artists in the forefront of political protest art in the early twentieth century; art and music during the Holocaust and to memorialize it; the flourishing of Jewish art and music in both traditional and new forms since World War II. The historical, social, and intellectual contexts of the development of music and art, rather than technical aspects of musical and artistic creation and perception, will be emphasized. In particular, the role of music and art in preserving Jewish pride and identity under two threatening circumstances – periods of persecution where survival was threatened and periods of toleration where conversion and conformity become alluring – will be considered.

In addition to looking at and listening to works of art and music, written texts describing the historical and social contexts and providing information about the works and their creators will be discussed.

J ST 434 Media and the American Jewish Experience (3) Study of United States Jewish history through film and accompanying written text.

J ST 434 Media and the American Jewish Experience (3)
The course examines theater, radio, television, and film as important sources for understanding the Jewish experience and its impact on American culture more generally since the late 19th century. The role of Jews as prominent directors, producers, actors, and writers will be considered in their social-historical context in addition to the subjects covered in the works and programs they have created. Among the topics discussed will be Jewish life in late 19th-early 20th century Europe; immigrant life in turn of the century America and questions such as assimilation, preservation of tradition, family life, social mobility, and male/female relations; Jews in show business, organized crime, and sports; American Jews and the Holocaust; American Jews and Israel; Jews in the modern age; generational and denominational differences among Jews; and Jews and anti-semitism.

J ST 450H (PL SC 450H) Genocide and Tyranny (3) This course focuses on the conceptualization and socio-political determinants of genocide and tyrannical regimes, with an emphasis on the Holocaust.

The Pennsylvania State University
This course focuses on the etiology of mass killing, with an emphasis on the socio-political determinants and consequences of massacres, ethnic cleansing, and other crimes against humanity. It is designed to help students understand genocide as a phenomenon of political violence and to explore the epistemological issues associated with the study of genocide. Students will learn to use the study of specific events (such as the Holocaust) to understand broader concepts and phenomena (in this case: genocide) as well as to develop analytical and communication skills through active discussion in class sessions.

The course is divided roughly into three parts: The objective of the introductory part of the course is to situate genocide as an act of political violence, and to create a working definition of the concept for the topics covered in subsequent weeks. In the second part various aspects of the Holocaust will be examined. Starting with a history of the Holocaust, we will cover philosophical, political, and military explanations for it. Some of the questions we will discuss in this part of the course include: (a) How does the Holocaust fit into the typologies of genocide? (b) Can extreme genocide that can be studied in a comparative context with the Holocaust? Does the “uniqueness” of the Holocaust influence the manner in which we study it? (c) Were the determinants of the Holocaust rooted in larger social and political factors? (d) Which contemporary political factors were associated with the Holocaust? During the last part of the course, we will discuss three other instances of genocidal violence: Armenia, Yugoslavia, and Rwanda. These events will be discussed using the same theoretical and analytical approaches as in the previous weeks. The concluding sessions will also focus on the questions of why it is important to study genocide, what lessons can be learned from understanding such events, and whether studying genocide is relevant to the current international system. Course topics will be discussed in light of assigned readings and films.

This course fulfills the distribution requirement for international relations, as well as the advanced and related course requirements for Political Science majors. The course fulfills the supporting course requirement for International Politics and Jewish Studies majors.

J ST 457H (US;IL) (ANTH 457, SOC 457) Jewish Communities: Identity, Survival, and Transformation in Unexpected Places (3) Examines the global array of smaller Jewish communities that have flourished outside the main urban centers of Jewish settlement.

J ST (ANTH/SOC) 457 Jewish Communities: Identity, Survival, and Transformation in Unexpected Places (3) (US;IL)

This course addresses an understudied aspect of Jewish experience. It aims to expand our understanding of Jewish communities by focusing on those that are, alternatively, small, situated in out-of-the-way places, culturally outside the Jewish urban mainstream, or embedded in a larger society with markedly different values and traditions. These communities often constitute the points-of-contact between Jews and non-Jews, and in so doing sometimes transform Jews, non-Jews, and the relationships among them. Other such communities constitute experiments in Jewish lifeways and provide mainstream Jewish worlds with pilot projects for potential social and cultural change. This course will explore the significance of small, little-known, idiosyncratic, and anomalous Jewish communities on Jewish history and culture, and draw on them to instruct students on the social and cultural processes of small or unusual communities generally. The communities studied will be located both in the U.S. and elsewhere in which Jews have lived as a minority community during modern times. The course will look at the founding, growth, and decline of such communities and at their social processes and institutions. It will explore how to understand and analyze such communities, which vary from one part of the world to another. The social world of Jewish communities, large and small, is a core interest of Penn State’s Jewish Studies Program. This course will complement the current offerings in Jewish Studies, strengthening the social, cultural, and contemporary perspectives available in the Program. It will provide students with an opportunity to explore individual experience and micro-level processes among Jews, and to study the dynamics of identity and survival. It will complement the current offerings in Sociology and Anthropology by affording an opportunity to focus on community-level social processes and by adding a course on contemporary Jewry. The course will integrate knowledge from a variety of sources and fields, promote intercultural understanding, and meet US and IL requirements. Materials will be interdisciplinary, and will include ethnographies, sociological studies, population studies, histories, and personal narratives. They will include primary texts, creative works, and scholarly analyses. The assignments will be structured to facilitate preliminary experience in independent analysis, library research, or field research. The course will be offered approximately once a year. Enrollment will be limited to 30 students in order to promote active, engaged learning. Evaluations will be based on short papers and outlines that will prepare students for their final, term papers.

J ST 468 Modern Jewish Philosophy (3) Explores the major figures in modern Jewish philosophy and their influences on contemporary philosophy.

J ST (PHIL) 468 Modern Jewish Philosophy (3)
The primary objective of this course is to encourage students to have a reflective stance on Jewish thought. Students will learn what comprises Jewish thought and how it is distinguished from theology. They will learn what role religion plays in philosophical thought and what is at stake for a philosophy that emerges from a particular religion. This course will give students perspective on how Judaism links to other philosophical movements, for example, the enlightenment of the modern period. It will enable to think about Judaism from a theoretical perspective, adding a new dimension to what they might study from historical, sociological, or literary viewpoints. Some questions we will consider include: In what ways does it converge/diverge, with the philosophical strains that influence it? In what ways do particular events in history shaped Judaic thinking? Does Judaism, or Judaic thinking, have an essence? If so, what is it? What does Judaism mean for the Jews, and what does it mean for others? And finally, what role does mysticism have in the play between religion and philosophy? Students will be evaluated by written work (short papers and a longer seminar paper) and a class presentation.

J ST 478 (RL ST 478) Ethics After the Holocaust (3) Explores the philosophical effects of the Holocaust for thinking about the primary question: Is ethics possible?

J ST (PHIL/RL ST) 478 Ethics After the Holocaust (3)
(BA) This course meets the Bachelor of Arts degree requirements.

This course is an examination of ethical theories before the Holocaust and how those theories have failed, philosophically and empirically. Course topics will include the history of ethical theory, the nature and problem of evil, goodness and suffering, witnessing and testimony, and the promise of an ethics. This course provides students with philosophical approaches to the issues that emerge out of the events of the Holocaust. The course will help students expand their knowledge of the events of the Holocaust through a philosophical approach that does not merely expose them to what happened, but asks them to think about the implications of what happened: most specifically, how do we understand ethical life, if it cannot stop or confront evil? This course provides students with the philosophical approaches to the issues that emerge out of the events of the Holocaust. It will encourage them to think critically, write effectively and express their thoughts logically. Student evaluation will be based on weekly reaction papers, group presentations, and a final seminar paper. This course covers material in the history of philosophy, contemporary philosophy, and writings pertaining to the Holocaust in various forms (historical, literary documentary, and so forth). It provides links to other major areas in the history of philosophy, postmodernism, ethics, philosophy of religion, and Jewish history. It will be offered every other year.

**KINES 400 Adapted Physical Education (3)**

This is an undergraduate level course teaching students the basic concepts of planning and conducting physical education programs for children with physical, sensory, and/or intellectual impairments. This course will help the student to become more aware of the physical needs of children with disabilities and of the possibilities to professionally deal with these

The Pennsylvania State University
needs. The course requires the student to complete a 10-hour practicum, providing the opportunity to work with children with a disability. The practicum will be conducted in cooperation with physical education staff members working with various schools in State College. The children’s difficulties may range from emotional problems to severe physical and mental handicaps. Students are free to identify alternative practicum sites (e.g., work with a friend or family member with a disability). The requirements for the practicum may include: select a child who has a physical, sensory, or intellectual disability; write an Individualized Education Program (IEP) using the guidelines presented in the textbook; implement the IEP in a two-on-one teaching situation (two students, one child); keep a log of all the practice sessions; after completing the 10-hour practicum, write a final report based on the IEP. This final report should state the definition of the problem, the etiology, the general characteristics, the teaching techniques specific to the disability, an evaluation of the actual teaching strategies and an evaluation of the outcome of the practice (did it work?); and, present the findings orally (10-15 minute talk).

The student will generally be evaluated by exam, teaching activity, an oral presentation, and a final report.

KINES 411 Introduction to Musculoskeletal Injury and Rehabilitation (3) This course is designed to provide an overview of common musculoskeletal injuries and rehabilitation for pre-allied health and fitness professionals.

KINES 411 Introduction to Musculoskeletal Injury and Rehabilitation (3)

This course is designed to provide an overview of basic orthopaedic injuries and related musculoskeletal system dysfunctions as well as rehabilitation of those injuries and dysfunctions. Common orthopaedic injuries of all major musculoskeletal structures and tissues are discussed moving up the kinetic chain from the feet up the lower extremities, through the spine and out the upper extremities to the hands. Common injuries such as sprains, strains, fractures, tendinopathies, disc herniations, spinal stenosis, compartment syndromes, neural compression, carpal tunnel syndrome and thoracic outlet syndrome will be discussed. Anatomy and function of each body region will be reviewed prior to the discussion of injuries. Mechanisms of injury, tissue pathology and the tissue healing processes are reviewed. The role of inflammation in the healing of injured tissues will be explored and the variations in healing processes between tissues explained. Common surgical procedures for major injuries like anterior cruciate ligament tears will be presented. A general
The rehabilitation process is discussed and rehabilitation concepts unique to specific injuries are explored. Basic principles of the major components of a rehabilitation program are explained. These major components include the protection of healing tissue, pain control, swelling resolution, restoration of range of motion, facilitation of volitional control, enhancement of muscular strength and endurance, improvement of neuromuscular control, training of functional movement patterns and return to functional activities. The RICE (Rest, Ice, Compression, Elevation) method of treating pain and limiting swelling will be presented. Manual therapy, stretching and exercise activities used to regain range of motion will be explained. Exercises used to improve muscular strength and endurance will be discussed for each region of the body. Methods of facilitating balance and neuromuscular control will be demonstrated. Finally, the benefits of functional exercise in terms of three-dimensional exercise requiring the use of groups of synergistic muscles in a coordinated manner will be presented. In addition, return to sport programs that gradually reintroduce the patient to the real life stresses placed on their injured body part will be explained. Prioritization of addressing the different components of a rehabilitation plan will be discussed and differences between surgical and non-surgical rehabilitation plans presented. Criteria used to make return to play decisions for injured athletes will also be outlined. Modifications of common exercises to accommodate for injuries and allow continued participation in exercise routines will be presented.

This course is appropriate for pre-allied health professionals and fitness professionals with an interest in orthopaedic injuries, musculoskeletal system rehabilitation and the construction of exercise programs that prevent, or accommodate for, musculoskeletal problems.

**KINES 420 Psychosocial Dimensions of Physical Activity (3)**

*Psychosocial Dimensions of Physical Activity (3)*

**General Education:** None  
**Diversity:** None  
**Bachelor of Arts:** None  
**Effective:** Summer 2011

**Prerequisite:**

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**KINES 421 Exercise Psychology (3)**

*Exercise Psychology (3)*

Exercise Psychology is designed to introduce students to the psychological antecedents and consequences of exercise behaviors. The antecedents of exercise behaviors are the psychosocial and cognitive factors (e.g., beliefs, attitudes, personality traits) that facilitate and/or inhibit exercise behaviors. The consequences of exercise behavior are the physical, psychosocial, and cognitive outcomes (e.g., self-efficacy, body image, mental health) of exercise participation. The antecedents and consequences of exercise behaviors will be presented within the context of contemporary conceptual and theoretical models in exercise psychology. This course is designed to provide students with an overview and foundation of the important psychosocial phenomena related to these antecedents and consequences of exercise behaviors. Students will have the opportunity to apply their knowledge in selected areas within exercise psychology through class discussions and assignments.

**General Education:** None  
**Diversity:** None  
**Bachelor of Arts:** None  
**Effective:** Spring 2014

**Prerequisite:**

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**KINES 422 Physical Activity Interventions (3)**

*Physical Activity Interventions (3)*

This course is designed to acquaint undergraduate students with the application of major theories and models used to design and guide the development of contemporary physical activity interventions. Students will be familiarized with empirically-supported principles of behavior change and will gain an understanding of the basic strategies and methods used in designing, planning, implementation, and evaluation of physical activity interventions. The course will cover a variety of approaches to physical activity promotion, ranging from clinical and community-based interventions to population-based approaches, while discussing practical strategies and concrete examples of contemporary, evidence-based physical activity interventions. The goal of the course is for students to demonstrate the ability to
formulate well-conceived physical activity interventions across a variety of settings and participant populations and learn how to apply theoretical principles and research findings to intervention development.

KINES 423 Psychology of Sports Injuries (3) Psychological causes and consequences of sports related injuries in athletes.

KINES 423 Psychology of Sports Injuries (3)

Using lectures/whole class discussion formats, this course is intended to provide the students with the basic knowledge regarding psychological causes and consequences of sport-related injuries, including concussions. Specific course objectives include: (1) developing the proficiency in initiating interviews and observations of athletes suffering from sport-related injuries; (2) assessing psychological impact of injury on athletes; (3) developing critical-thinking skills related to the probability of developing of psychological trauma in athletes with injuries; (4) developing specific skills of psychological assessment of injured athletes; (5) stimulating thinking about temporary research questions as related to psychology of injury. Evaluation will be based on active engagement in class discussions and administration of quizzes and written examinations according to course syllabus. This class extends but does not duplicate existing courses in the Departments of Kinesiology and Psychology.

KINES 426 Physical Activity and Public Health (3) Examines the role of physical activity in public health. Includes population level strategies for promoting physical activity in communities.

Physical Activity and Public Health (3)

An examination of the role of physical activity in public health. The first half of the course will provide an introduction to public health and basic epidemiology, measurement, dose-response relationships, chronic disease prevention. We will examine the historical progression of physical activity as a part of public health, including landmark studies showing the relationships between physical activity and chronic disease morbidity and mortality. Current public health guidelines and national policies related to physical activity will be discussed in detail. Students will debate the scientific foundation for current issues in the field, including fitness vs. fatness as a predictor of health outcomes and comparing behavior vs. objectively measured variables. The role of physical activity in preventing cardiovascular disease, type 2 diabetes, obesity, and cancer, colon and prostate cancer will be discussed. We will focus on large scale epidemiologic studies that highlight prevention.

The Pennsylvania State University
The second half of the class will focus on a social ecological framework for promoting physical activity and will address population level approaches through policy and environmental strategies, following the Centers for Disease Control and Prevention Task Force for Community Preventive Services guidelines. We will study how features of the built environment can encourage or discourage walking and biking and refer to current research in the field that examines these relationships in different populations (urban/rural, youth/older adults). We will learn about the challenges associated with assessment and measurement at a population level. Policy level approaches to physical activity promotion; including local, state and national; will also be discussed. We will discuss various community level approaches including: point-of-decision prompts, mass media campaigns, enhancing access to physical activity opportunities and other strategies outlined in the guidelines. Lastly, we will examine how physical activity promotion is addressed in other countries through community, policy and environmental strategies in Canada, Australia, Brazil and throughout Europe.

KINES 427 (HD FS 427) Developmental Sport & Exercise Psychology (3) Developmental changes in the antecedents and consequences of physical activity across the lifespan.

KINES (HD FS) 427 Developmental Sport & Exercise Psychology (3)

Change is constant with physical activity - our reasons for being active change across the lifespan and our experiences with physical activity change how we view ourselves and those around us. Developmental Sport & Exercise Psychology focuses on developmental changes in the psychosocial antecedents and consequences of physical activity across the lifespan. Specific course objectives include (1) describing theoretical frameworks and methods used to study physical activity-related psychosocial development across the lifespan, (2) describing how self-perceptions develop and influence behavior in movement contexts at different points in life, (3) explaining how contextual factors influence developmental processes associated with physical activity, (4) identifying age-related differences in activity-related antecedents and consequences of physical activity, and (5) developing, reviewing, and critiquing theoretically-grounded interventions to address issues related to developmental processes associated with physical activity across the lifespan. Evaluation will be based on written examinations, submission of a series of reflection papers on reading assignments, a group presentation, and the students' engagement in the class. It extends but does not duplicate existing courses in the Department of Innersole, Human Development & Family Studies, and Psychology.

KINES 428 Motivation and Emotion in Movement (3) Theories of motivational and emotional processes and their applications in movement settings.

KINES 428 Motivation and Emotion in Movement (3)

Motivation & Emotion in Movement will focus on the psychological processes underlying human motivation and emotion in movement settings. Special attention will be directed to social manipulations that can enhance motivation and emotion, and the consequences thereof. This course will be valuable for students whose career goals relate to education, personal training, rehabilitation, coaching, or psychology. Specific course objectives include (1) distinguishing between motivation and emotion, (2) understanding psychological mechanisms underlying common motivational and emotional processes in movement settings, (3) identifying existing applications of motivation and emotion theories in movement settings, and (4) developing, reviewing, and critiquing theoretically-grounded interventions to address issues related to motivational and emotional processes in movement contexts. It extends but does not duplicate existing courses in the Departments of Kinesiology and Psychology.

KINES 429 Psychology of Sport Performance (3) Psychological theories of talent development and performance enhancement in sport.

The Pennsylvania State University
KINES 429 Psychology of Sport Performance (3)

Psychology of Sport Performance will provide a psychological perspective on the phenomenon of superior motor performance. The course will cover nature of superior performance, talent development processes, sources of performance crises, and self-regulation strategies used by athletes, coaches, and psychologists to enhance performance. This course will be valuable for students whose career goals involve training athletes or other performers involved in socially-evaluative performance domains. Specific objectives include (a) distinguishing the antecedents and consequences of subjective and objective performances, (b) conceptualizing motor performance and performance problems in a psychological context, and (c) matching psychologically-based performance problems with theoretically-based intervention strategies. It extends but does not duplicate existing courses in the Departments of Kinesiology and Psychology.

KINES 434 Rehabilitation of Injuries to the Lower Extremities (3) Theoretical foundation and laboratory experience in manual therapy techniques and therapeutic exercises for the lower extremities.

KINES 434 Rehabilitation of Injuries to the Lower Extremities (3)

Rehabilitation of Injuries to the Lower Extremities is a 3-credit course offered each fall semester with an enrollment limit of 40 students. The course provides students who have been accepted into the undergraduate athletic training option in the Department of Kinesiology with the theoretical foundation for application of manual therapy techniques and therapeutic exercises in the treatment of musculoskeletal injuries sustained by physically active individuals. Laboratory instruction and guided practice in performing manual therapy techniques and therapeutic exercises will also be provided. At the end of this course students: 1) can identify five components of a comprehensive plan of care for an injured athlete; 2) have a working knowledge of the effects of therapeutic exercise on tissue repair and return to activity; 3) have a working knowledge of the impact of pain on programs and therapeutic exercise; 4) are able to perform selected manual therapy techniques and integrate them into a comprehensive plan of care; 5) understand the psychological response to injury and therapeutic exercise; 6) can develop a plan of rehabilitation utilizing principles of tissue healing, therapeutic exercise and manual therapy; and 7) instruct patients in home programs of therapeutic exercise. This course will focus on the basic principles of therapeutic exercise and rehabilitation of injuries to the lower extremities.

This course will be offered every Fall semester with an anticipated enrollment of 25. Evaluation includes quizzes, rehabilitation plan of care, proficiency notebook, mid-term and final practical exams, and written mid-term and final exams.

KINES 435 Rehabilitation of Injuries to the Trunk and Upper Extremities (3) Theoretical foundation and laboratory experience in manual therapy techniques and therapeutic exercises for the trunk and upper extremities.

KINES 435 Rehabilitation of Injuries to the Trunk and Upper Extremities (3)

Rehabilitation of Injuries to the Trunk and Upper Extremities is a 3-credit course offered each fall semester with an enrollment limit of 40 students. The course provides students who have been accepted into the undergraduate athletic training option in the Department of Kinesiology with the theoretical foundation for application of manual therapy techniques and therapeutic exercises in the treatment of musculoskeletal injuries sustained by physically active individuals. Laboratory instruction and guided practice in performing manual therapy techniques and therapeutic exercises will also be provided. At the end of this course students: 1) can identify five components of a comprehensive plan of care for an injured athlete; 2) have a working knowledge of the effects of therapeutic exercise on tissue repair and return to activity; 3) have a working knowledge of the impact of pain on programs and therapeutic exercise; 4) are able to perform selected manual therapy techniques and integrate them into a comprehensive plan of care; 5) understand the psychological response to injury and therapeutic exercise; 6) can develop a plan of rehabilitation utilizing principles of tissue healing, therapeutic exercise and manual therapy; and 7) instruct patients in home programs of therapeutic exercise. This course will focus on review of the basic principles of therapeutic exercise and rehabilitation on injuries to the trunk and upper extremities.

This course is offered every spring semester with an anticipated enrollment of 25. Evaluation methods include quizzes, written and practical exams, rehabilitation plan of care and proficiency notebook.
KINES 436 Therapeutic Modalities in Athletic Training (4)

Introduction to Therapeutic Modalities is a 4-credit course offered each spring semester with an enrollment limit of 40 students. The course provides students who have been admitted into undergraduate athletic training option in the Department of Kinesiology with the theoretical foundation for the application of contemporary therapeutic modalities in the treatment of musculoskeletal injuries sustained by athletic individuals. At the end of this course students will: 1) have a working knowledge of the inflammatory response to tissue injury, pain perception and the body's analgesic mechanisms; 2) understand the physical principles of thermal, acoustic, electrical, light and mechanical modalities; 3) understand the physiological response to thermal, acoustic, electrical, light and mechanical modalities; 4) be able to search for and appraise clinically relevant trials involving modality application and; 5) apply these understandings and thermal, acoustic, electrical, light and mechanical modalities in the safe and effective manner. Students are evaluated through written examinations, laboratory examinations and submitted written reviews.

KINES 438W Administration and Issues in Athletic Training (3)

This course is designed to instruct students in the concepts and skills required for successful administration of an athletic training program and to understand and discuss contemporary professional issues attendant to the Athletic Training profession. General topics to be covered include theoretical basis of management, program management, human resource management, financial resource management, facility design and planning, information management, athletic injury insurance, legal aspects of sports medicine, ethical considerations in sports medicine, preparticipation physical and drug-testing, professional preparation issues, professional practice issues, and clinical practice issues. Experts from the community are brought in to lecture on several of the topics. The course meets for three hours per week and utilizes both lecture and discussion formats. Student assessment includes written examinations, written homework assignments, class participation and debates. This is a writing intensive course. Writing will be used to facilitate critical thinking about course material. Written assignments are based on the technical writing requirements of an athletic training administrator and are graded on both their content and quality.

KINES 439W Ethics in Sport and Sport Management (3)

Analysis of moral dilemmas in sport and sport management utilizing the tools of ethics.
KINES 440 Philosophy and Sport (3) An examination of human nature from the perspective of our participation in sport.

KINES 441 (US) (AM ST 441) History of Sport in American Society (3) Background, establishment, and growth of sport in America from colonial times to the present.

KINES (AM ST) 441 History of Sport in American Society (3)

Study of the background, establishment, and growth of sport in America from colonial times to the present, and the role of American sports in American culture and society. The course will examine the ways that sports have operated in the United States as the country has developed into a modern, mass society. Issues of national identity, commercialism, race, ethnicity, class, and gender will be discussed in relation to the popularity of sports. Another set of issues will center on language and media; students will employ methods of analysis such as ethnography and rhetorical criticism that emphasize the multiple layers of meaning inherent in sports culture. The course satisfies the "area" requirement in "society" for American Studies majors. It is offered once every two years and enrolls approximately 30 students.

KINES 442 (IL) (CAMS 442) Sport in Ancient Greece and Rome (3) An examination of the continuity of sport in ancient Greek and Roman societies.

KINES (CAMS) 442 Sport in Ancient Greece and Rome (3)

This course examines the continuity of sport in ancient Greek and Roman societies. It investigates the role of athletic festivals in both cultures as well as the value placed on physical activity as part of the educational process.

The objectives of the course are to enable students to gain an appreciation for the continuous involvement of the ancient Greeks in the areas of competitive athletics and gymnastics[Kinesiology] as an important part of their value system. Moreover, the course will provide a comparison of Greek and Roman attitudes of athletics and gymnastics.

Typical topics include athletics during the Minoan /Mycenaean Bronze Age, Athenian and Spartan philosophies regarding education, the importance of spectator sports in Roman society and their link to politics.

KINES 445 Alcohol and Drug Education (3) Principles of integration and coordination of alcohol and drug education programs for health education and other health related professions.

KINES 446 History of Sport in the Modern World (3) History of sport in modern world, ca. A.D. 1500 to present; concentrates on role of sport in societies outside United States.

KINES 446 History of Sport in the Modern World (3) (IL)
The History of Sport in the Modern World introduces students to the connections between sporting practices and the broader cultural, political, intellectual, and economic patterns that shape societies during the modern period in world history (ca. A.D. 1500 to the present). The course begins with a foray into the transition from traditional to modern forms of sport and society and covers the development of a wide variety of athletic games and pastimes from the sixteenth through twentieth centuries. Students will encounter a variety of historic conceptions of sport and explore the role of sport in the development of European, North American, Latin American, Asian, African and Pacific cultures. Students will learn how sports have been shaped by and have shaped by multiple factors, including modern ideas, science, class structures, gender roles, constructions of race, urbanization, nationalism, political conflicts, international relations, and economic institutions.

This is a senior-level course that fills an important historical gap in the Kinesiology Department's sequence of offerings on the history of sport. Other courses in the sequence cover ancient sport, sport in American society, and the Olympic Games. While crucial American developments that impact sports in the modern world are incorporated into this course, this class offers students a global focus that concentrates on the role of sport in societies beyond the borders of the United States. This course also relates to the offerings in the philosophy of sport program by exploring the history of ideas about sport in modern thought. Additionally, the course connects to the science-based offerings in Kinesiology by providing students with an introduction to the history of the scientific study of human performance.

The course introduces students to basic readings and knowledge of the history of sport in the modern world. The class provides opportunities to practice the critical reading and thinking techniques that shape the historian's approach to knowledge. This course will be taught once every year with an anticipated enrollment of 50 students. Evaluation methods that test reading and critical thinking skills are employed. No special facilities are required.

KINES 447W Representing Sport in Popular Film (3) Critical, contextual, and theoretical analyses of sport films focusing on popular narratives of social inequalities.

KINES 448 Coping with Life After Sport (1) Psychosocial concerns affecting student-athletes as they enter the transition period following sport disengagement, focusing on coping interventions.

KINES 448 Coping with Life after Sport (1)
KINES 448 is designed for student athletes who have exhausted their eligibility for or will no longer be participating in...
their respective sport due to injury or other issues. It is also relevant for students in athletic training or those who plan to pursue a career in coaching. The focus of the course is on the identification of issues and stressors affecting the transition and the development of strategies and coping skills to deal with life after sport. This can often be a very emotional and difficult time for student athletes. Discussion is focused on intervention and coping strategies, goal setting, decision making, career planning, and transferable skills. Student athletes will be able to recognize how their athletic experience has helped them to acquire numerous skills and characteristics highly valued in the workplace. Two sections of the course will be offered each semester. Students will be required to submit a weekly reaction paper, do a review of literature, and compile a comprehensive career plan. The class will be highly interactive with regular in-class assignments and projects.

KINES 452 Applied Cardiovascular Physiology (3) In-depth study of cardiovascular regulation during postural, environmental, and exercise stress.

KINES 452 Applied Cardiovascular Physiology (3)

First, the course begins with an intensive review of hemodynamics and basic cardiovascular control mechanisms (neural, hormonal, and local regulation).

Second, students compare and contrast these general principles in six important circulations: splanchnic, renal, cerebral, coronary, cutaneous, and muscle.

Third, they examine the three stresses which affect the circulation: posture (gravity), environment (especially heat) and exercise. For each stress, students identify the regional circulation(s) most affected and how they contribute to an integrated (systemic) cardiovascular response that is unique for each stress.

Finally, combinations of posture, heat, and exercise stress are considered to illustrate competing cardiovascular control mechanisms.

At each step students are introduced to seminal research papers illustrating the concept being studied.

KINES 454 Women’s Health and Exercise Across the Lifespan (3) In-depth study of the physiological role of exercise in modulating the health of girls and women during different phases of the lifespan.

KINES 454 Women’s Health and Exercise Across the Lifespan (3)

First, the course begins with a review of general principles of research conduct and publication, themes that will be carried throughout all material covered in this class. A review of the historical aspect of women’s health research and a review of the state of knowledge in women’s health in the wake of the contemporary scientific endeavors such as the Women’s Health Initiative will also be explored. Second, students will learn physiology of puberty, menstrual function and bone health and the impact of exercise on these processes. Third, students will learn current conceptions of exercise related to the female athlete and clinical implications of alterations in normal physiology. The impact of oral contraceptives on health and exercise performance will be also discussed. Fourth, students will learn menopausal physiology, alterations in clinical status associated with this life stage, and review current research related to the Women’s Health Initiative. Finally, a discussion of the effects of gender differences on health and exercise will be discussed. At each step students will be exposed to relevant research methods issues, and introduced to seminal research papers illustrating the concept being evaluated.

This course is designed for students who wish to develop a richer understanding of the physiological role of exercise in modulating the health of girls and women during different phases of the lifespan. Particular attention will be given to the
The course will expose students to the rich research literature in women’s exercise and health across the lifespan. Students will improve their ability to read and summarize original research literature through in depth presentation and discussion of seminal studies. Moreover, students will develop an understanding of how research has informed the state of knowledge on issues covered in this class and students will develop “language understanding” appropriate for interpreting and reading research papers.

KINES 455 Physiological Basis of Exercise as Medicine (3)
This course is designed for students interested in developing a deeper understanding of the physiological mechanisms behind exercise as medicine. Course content will consist of a mixture of selected book chapters as well as contemporary review and primary research articles. This course begins with an overview of the current exercise deficiency problem, including the societal, behavioral, and economic changes of the past century which have contributed to the modern day epidemic of chronic inactivity-related disease. After developing an appreciation for the scope of these problems, students will be introduced to the “tools” needed to critically evaluate the association between exercise and/or inactivity on health and the mechanisms by which these associations may occur, including: basic principles of epidemiology, searching/reviewing scientific literature, and experimental design. The remainder of the course will be focused on how exercise/physical activity modifies molecular/tissue-level and integrative physiological function, and describes the extent to which these modifications confer either preventative or therapeutic benefit. This will be accomplished through a combination of lectures, in-class/take-home assignments, as well as student-led discussions. Students will also use the “tools” that they learned at the beginning of the semester to demonstrate and share knowledge with others; integration of this information may include a thorough analysis of a chronic condition including the pathophysiology, strength of evidence for exercise is medicine, and physiological actions of exercise in prevention or treatment. Students may also be given the opportunity to translate their knowledge from this course into educational materials (e.g., flyers, pamphlets, screensavers, fitness center displays, social media, etc) for use during “Exercise is Medicine” week.

KINES 456 Physical Fitness Appraisal (4)
The basic components of physical fitness, how it can be measured, and how it can be developed.

KINES 457 Exercise Prescription and Case Studies (3)
The major purpose of this course is to provide those students interested in allied medical careers (e.g., cardiac rehabilitation, hospital testing, wellness centers, corporate fitness centers, physical therapy) with skills and practical knowledge regarding exercise diagnostics and prescription. Particular emphasis is placed on clinical diagnostic procedures, interpretation and terminology and this course directly contributes to the knowledge base expected for future employment in this area. At the conclusion of KINES 457, the students will be able to demonstrate on written examinations and in discussions, a knowledge and understanding of basic exercise prescription principles for apparently 

The Pennsylvania State University
healthy, at risk and diseased populations, with special emphasis on the cardiac patient. Inherent in the course goals is an understanding of the chronic physiological adaptations that occur as a result of programs of endurance and resistance exercise in apparently healthy, at risk and diseased populations.

This course includes lectures as well as hands-on laboratory sessions. Evaluation is based on student performance on written examinations, written and oral case study presentations, and written assignments. This course will be taken after students have completed KINES 456 and will complete the learning scheme involving fitness appraisal and subsequent prescription of exercise programs.

The course is offered fall and spring semesters with an enrollment of 35 students.

KINES 461W Preparation for Research Project (2) Planning and preparation for research project.

KINES 461W Preparation for Research Project (2)

This course prepares students to conduct a research project in KINES 462W. Students will begin by critically examining different research approaches. They will explore the development and assessment of research topics paying special attention to both scientific and philosophical justifications. They will learn how to identify research populations and how a human subjects review protects those involved in research studies. They will identify and critique the various inventories and assessment tools available for the kind of research they propose. Students will complete a research proposal including review of literature and method section, and submit an application to the Institutional Review Board. These goals will be achieved through a series of writing assignments.

Students are expected to demonstrate the following outcomes:
1) Communicating and writing ideas relevant to the field of Kinesiology.
2) Understanding and describing the major issues in the field.
3) Understanding the principles of how to conduct research in wellness, fitness and/or associated practice.
4) Understanding and communicating the methods of scientific discovery.

Students are evaluated on their research proposal (50% of final grade) which is drafted and revised during the semester. Further writing assignments (50%) assess and enhance student’s competency in research methods and statistics. The course is offered every fall semester with a total enrollment of 25 each semester.

KINES 462W Research Project (2) Completion of research topic.

KINES 462W Research Project (2)

During this course students will collect and analyze data for a research project. They will trouble shoot any data collection problems and learn how to use computerized programs for statistical analysis of data. They will learn about various presentation modes relevant to the written and oral presentation of research data. Students will prepare and be evaluated on a research paper that reports on their research project. In addition, they will present their work orally in showcase sessions to which fellow students and faculty members are invited. The goal is for students to produce as close as possible to publishable papers. This course is part of a two-course sequence and can only be taken upon successful completion of KINES 461W. It, along with the internship experience, are the culminating experiences in the Exercise Science - Science Emphasis. Facilitates needed will be determined based on the individual research project. This course will be offered only in the spring semester of each year. Enrollment will vary from 1 to 25.

The Pennsylvania State University
KINES 463 Acquisition of Motor Skills (3) Examination of principles of motor learning; the application of strategic factors such as: practice types, schedules, augmented information, and motivation.

KINES 463 Acquisition of Motor Skills (3)
This course is intended for students interested in the principles of motor learning (learning, retention and transfer) and the application of specific learning strategies such as, practice, feedback, demonstrations, and instructions. Through lectures, discussions, and course readings in addition to writing assignments, the goal is for students to develop a unified conceptual framework for motor learning and its facilitation through intervention strategies.

The evaluation for the final grade will be based upon a synthesis of assessment in three areas: a) Term Project (30% of final grade) - a report on a learning experiment or a synthesis paper on a learning principle or a learning strategy; b) Mid-Term Exam (30% of final grade) - questions requiring short 2-3 sentence answers; and, c) Final Exam (40% of final grade) - requiring essay length answers to selected questions that integrate key issues from all the course material.

This course will build on the concepts outlined in KINES 171 and 360. It will represent the culminating upper level undergraduate course in motor learning. This course will be an elective available to students who have completed the required KINES 360 course. It can be used to fulfill requirements for the Kinesiology major and the Movement Science, Teacher Preparation, and Athletic Training Options.

This course will be available to students outside of the Kinesiology major who may, upon approval, substitute the KINES 360 prerequisite requirement. The course will be offered every spring semester.

KINES 464 Children's Physical Education Curriculum and Practicum (3) Curriculum for elementary school physical education emphasizing the skill theme approach.

KINES 464 Children's Physical Education Curriculum and Practicum (3)
The purpose of this course is to introduce teacher candidates to the skill theme approach and developmentally appropriate physical education for children. Appropriate planning, instruction, and assessment make-up the foundation of this course. These techniques are then applied when they teach small groups of children from a local elementary school. Specifically, students will develop and implement developmentally appropriate lesson plans with children and then analyze and reflect on their teaching effectiveness. A primary focus of the class is using the skill theme approach to guide children to reach appropriate cognitive, affective and motor objectives as stated in state and national standards. Students also develop curricular scope and sequence overviews that are used to guide curriculum and lesson development from grades K-5.

Assessment of student performance in the course includes entrance and exit slips based on assigned readings, class lectures and discussion, and laboratory experiences. Students are also graded on their planning, analysis and reflection of their teaching in elementary schools. There is also a final exam that requires students to translate theory into practice as applied to elementary school physical education.

Assessment:
Enterance and exit slips 15%  
Teaching in the schools 40%  
Final exams 15%  
Project 15%  
Laboratories 15%

KINES 465 Neurobiology of Sensorimotor Stroke Rehabilitation (3) This course is designed to expose students to the recent topics in motor stroke rehabilitation research through literature.

The Pennsylvania State University
KINES 465 Neurobiology of Sensorimotor Stroke Rehabilitation (3)

This 3-credit course is designed to expose students to the most recent topics in motor stroke rehabilitation research through reading of current literature. The course addresses the neurobiological foundations of motor deficits in stroke, including contralesional and ipsilesional effects, current research on mechanisms of motor recovery, and the most current research on intervention strategies, such as constraint induced therapy, robot aided rehabilitation, virtual reality therapy, and sensory motor interventions. The purpose of the course is to provide an understanding of the neurophysiological and biomechanical foundations of motor deficits that occur with stroke, and of current treatment approaches.

Stroke presents a significant social problem that is emphasized in current statistics reported by the American Heart Association indicating that each year, about 780,000 people in the United States experience a new or recurrent stroke. While stroke can produce deficits in perceptual, cognitive, and motor processes, this course is focused on sensorimotor deficits and associated rehabilitation interventions that tend to be employed by physical and occupational therapists in the rehabilitation environment.

Sensory-motor strokes often result in weakness and deficits in voluntary movement of the limbs on the opposite side of the body as the damaged hemisphere (Contralesional). These motor deficits currently receive primary focus in occupational and physical therapy treatment for stroke. However, regardless of improvements in contralesional arm function, most patients also show deficits in coordination of the ipsilesional arm that is on the same side of the body as the damaged hemisphere. For many hemiparetic patients, functional recovery relies heavily on this arm. This class will focus on understanding both ipsilesional and contralesional motor deficits in stroke. Physiological and biomechanical mechanisms of dysfunction will be emphasized. Recovery of function will be addressed through analysis of physiological and biomechanical measures that are used to track changes in neural function. In addition, current research that is focused on developing rehabilitation intervention protocols that systematically address remediation of dysfunction, and facilitation of recovery will be discussed.

Students will be guided in reading, critiquing, and presenting primary scientific manuscripts and review articles. Active discussions of presented material are encouraged, and grades are based on presentations, quizzes, and participation in class.

KINES 466 Assessment and Evaluation in Physical Education and Health Education (2) Explores measurement as an important and distinct component in a variety of physical education and health education contexts.

KINES 466 Assessment and Evaluation in Physical Education and Health Education (2)

This course addresses measurement as an important and distinct component of other processes such as assessment and evaluation in a variety of physical education and health education contexts (i.e. student performance, teacher performance, program outcomes). Teacher candidates will explain the inter-relationships among objectives, learning activities, and measurement strategies. They will design performance-based and standards-based measurement plans and tools that are necessary when assessing, evaluating, researching or making decisions about performances in physical education and health education. These plans will be performance-based, include select response and constructed response measurement instruments; measure what matters most in all learning domains; and demonstrate that instruction and assessment are seamless. These performances can range from constructed-response or non-traditional performance tasks like motor skill performance, fitness assessments, oral presentations, written reports, portfolios, program evaluation, and teaching effectiveness. Teacher candidates will be expected to recognize many and develop a few authentic and traditional measurement techniques/tools (including peer and self-assessments). These techniques and tools will assess student understanding and performance, provide feedback, and communicate student progress. These tools will measure what matters most and be valid and reliable. These tools are to be embedded with instruction and used by self, peer and instructor. When available, these tools will be integrated with technology to enhance the management of data. In this course, teacher candidates will recommend strategies for implementing results of a measurement by identifying implications from findings for future curricula, instructions, and other activities. They will differentiate between formative and summative measurements and describe ways the lesson/unit/curricula can be improved based on measurement results. Teacher candidates will also demonstrate their ability to interpret results and infer implications from the findings. For example, identifying instructional gaps between learning activities and objectives and using learning and performance data to make informed curricular and/or instructional decisions. In doing so, teacher candidates will contrast the results of norm- and criterion-referenced evaluation. This course will complement existing Methods courses (field experiences) in our teacher preparation curriculum by aligning instructional planning and implementation with measurement of these learning experiences. Teacher candidates will be evaluated with quizzes, assessment plans, measurement tool development, data collection and data interpretation. One section of this course will be offered each semester with a projected enrollment of 25 students.

The Pennsylvania State University
**KINES 468 Health Instruction in the School-Content and Method (3)**

This course is designed to prepare future middle and secondary school health and physical education teacher candidates in teaching health by providing a framework for comprehensive school health education, up-to-date health knowledge in ten areas of health, and designing the classroom as a laboratory in which students develop and practice teaching skills for health.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2006
Prerequisite:

**KINES 469W Curriculum Development in Health and Physical Education (3)**

The purpose of this course is to prepare prospective health and physical education teachers to plan and design curricular content that meets the needs of students in grades K-12 and aligns with state and national standards. The philosophical and theoretical basis for curricular decision-making will be explored.

Instructional Objectives:
1. design a physical education curriculum outline for a selected school setting (elem, middle, secondary)
2. design a health education curriculum outline for secondary or middle school health
3. assess a current HPE program and the extent to which the program is consistent with good practices, national standards, and state standards

Relationship of course to other courses:
This is the only course that addresses Health and Physical Education Curriculum Design. Students take this course after or concurrently with three--methods--intensive courses. This course serves as the capstone course in the Teacher Preparation option. It applies pedagogical content knowledge in health and physical education to curriculum models and design. Students take this course the semester before student teaching.

Projected offering and enrollment: this course is offered every semester and has an enrollment limit of 30

**KINES 481W Scientific Basis of Exercise for Older Adults (3)**

Study of age-associated physical changes and the effects of exercise on the aging process.

**KINES 483 Motor Patterns of Children (3)**

Development of motor patterns. Fundamentals of movement, basic motor skills, and adaptation of the body to external forces.
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

KINES 484 Advanced Biomechanics (3) The use of advanced biomechanics to provide an in-depth understanding of the principles which underpin human movement.

KINES 488 Mechanics of Locomotion (3) This course examines the forces and motions characteristic of locomotion, with emphasis on walking, the most common human activity.

KINES 488 Mechanics of Locomotion (3) (GHA)

Walking has been described as the most commonly performed human activity. Diseases or injuries that reduce the ability to walk independently and efficiently are especially likely to adversely affect quality of life. Kinesiology 488 introduces students to the elements of normal walking and how walking motions are affected by changes in age, walking speed, and pathological conditions. Advanced topics covered in this course include other forms of locomotion, including running and cycling, and the use of mathematical models to understand phenomena related to locomotion.

Students enrolled in this course learn the particulars of human locomotion, but in so doing they also gain an understanding of kinematics and kinetic analysis, joint mechanics, and the clinical treatment of movement disorders. Basic principles of mechanics are applied to establish how walking motions result from forces produced by muscles, gravity, and contact with the ground. Students planning to pursue graduate study in movement biomechanics or in clinical areas such as physical therapy are especially likely to benefit from the focus on these areas.

The requirements for Kinesiology 488 include two mid-term tests and a final examination, four laboratory reports, and a literature review. Laboratories (held during regularly scheduled class periods) introduce students to current experimental methods used to measure motions, forces, and muscle activity during locomotion. Completion of several case studies during the semester gives students practical experience with the interpretation of motion analysis data, the factors that influence clinical decisions in the treatment of movement disorders, and ethical considerations in biomechanics research.

KINES 492W Programming for Business and Agencies (3) Fundamentals of program development applied to corporate and private physical fitness businesses.
KINES 492W Programming for Business and Agencies (3)

This course will use an experiential approach to acquire knowledge and skills necessary to assess, plan, implement and evaluate health/wellness/fitness programs within a business/corporate setting. Students will actively participate in a process-oriented, student-centered learning environment that includes cooperative learning, critical thinking, effective communication, assessment, and problem solving. Students will assess, plan, implement and evaluate a health-related program (i.e., wellness fair, career fair, road race, fitness programs). Students will write business letters, operating plans, mini-grants, budgets, flyers, press releases, newspaper articles, surveys, and other written communication projects relevant to the fitness/wellness business. Students will access and evaluate health/wellness resources (i.e., agencies, Internet, media, speakers).

As indicated by the “W”, this is a writing intensive course and will follow university guidelines for such courses. Most of the assignments will involve group-based problem solving. This course is offered Spring Semesters with a maximum enrollment of 35.

KINES 493 Principles and Ethics of Coaching (3) Integration of the practical and theoretical knowledge necessary for effective coaching through classroom and field experiences.

KINES 493 Principles and Ethics of Coaching (3)

The Principle and Ethics of Coaching examines the challenges of today's coaching profession through societal norms and expectations from the past and present. The course begins with a study of the coaching profession covering past and current coaches who have experienced success and failure in the profession. Students learn how the profession has developed as a result of changing values, demands, emphasis and expectations in the athletic world. Students will learn how to work with Title IX, parents, high school and collegiate regulations, season structures and the various roles and responsibilities of today's coach. The course is a senior-level course providing students in Kinesiology with an in depth study of the profession that has historically been associated with careers in Kinesiology. This course relates to other courses in sport ethics, sport philosophy and history of sport as they provide the theoretical background for coaching decisions. In addition, this course demonstrates practical implementation of theories from nutrition as well as activity courses. The course offers students an in depth study of sport and gender specific differences as they relate to the coaching profession. The students observe, question and study current coaches while examining their own backgrounds to develop set of principles to handle today's coaching issues. A coaching experience is an optional opportunity afforded to students while writing skills must be demonstrated by all students through written exams, papers and/or projects. Enrollment is optimal at 20-25 students, however, larger numbers may be accommodated. The course will be taught during Fall and Summer semesters. The emphasis on class discussion and interaction with various athletic coaches introduces students to realities of today's coaching profession and the challenges of the 21st century coach. Video and power point enhance the multimedia approach to this course and further enhance the learning environment. Evaluation of the students requires an understanding of assigned readings, class discussion, and the student's ability to demonstrate critical thinking skills.

KINES 495A Practicum in Student Teaching (12) Supervised teaching of health and physical education in K-12 public schools with seminars focused on transition from student to professional.

KINES 495A Practicum in Student Teaching (12)
The teacher candidate will be placed in either an elementary or secondary school setting for the first 8 weeks of the student teaching experience, followed by placement in the level not selected first for the last 7 weeks. The teacher candidate will be teaching both health and physical education during each placement. The teacher candidate will be assigned on-site cooperating teachers will be supervised by a university faculty member who makes a minimum of four on-site visits, plus review of teaching via two videotape.

During the 15-week semester, there are four seminars of approximately 5 hours each, during which all teacher candidates meet with the coordinator of the student teaching program to discuss topics related to the multiple roles of teachers in public schools and the transition to becoming a professional teacher. In addition, some time in each seminar is devoted to experience sharing and collaborative problem solving. The following topics are covered during the seminars: legal liability and sexual harassment, electronic portfolios, resume and cover letter writing, health and physical education professionals, preparation for employment, interviewing, best teaching practices and sharing, classroom management, and technology in physical education. In addition, the student teachers are required to complete a variety of assignments including: a professional portfolio, unpaid service activity reflection, daily notebook, videotapes and reflection, and Pennsylvania teaching application and essay.

KINES 495E Advanced Professional Development in Kinesiology (3) Professional development preparation focused on knowledge, skills and abilities to complete national certification; obtain internships, employment or graduate school admission.

KINES 495E Advanced Professional Development in Kinesiology (3)

This course is designed to provide undergraduate students the opportunities of fitness professional pre-certification preparation via lecture format, professional travel to acquire hands-on skills at a top caliber training facility, and an expert panel round table discussions. Throughout the course, students will have exposure to professional communication with faculty through formats including, but are not limited to the following: faculty/professional/expert discussions, lectures, training sessions, quizzes and examinations that are designed to prepare students to pass a national certification. Students will enhance skills needed to develop exercise leadership characteristics, communicate information effectively, and build a foundation of exercise testing and prescription guidelines which are safe, effective and motivating to clientele. Other class foundational principles include but are not limited to Exercise Programming; Health Risk Assessment; Serial Testing; Metabolic Calculations; Nutrition and Weight Management and Facility Administration. Students will take practical experience and knowledge gained from this professional course and apply principles into their proposed field of study in a safe and effective manner.

**KINES 497C Nutrition, Exercise, and Sport Performance (3)** The course is designed to support critical thinking in exercise nutrition. This requires knowledge of fundamental principles of nutrition, exercise, and performance, as well as an understanding of the scientific methods that can be used to evaluate the benefits of harm of nutritional practices. These skills will enable students to independently acquire knowledge in the field of exercise nutrition, and to translate this knowledge into practice.

**Nutrition, Exercise, and Sport Performance (3)**

KINES 532 Pathoetiology of Musculoskeletal Injuries (3) In-depth study of physiological, mechanical, and neuromuscular mechanisms of common musculoskeletal injuries with applications for injury prevention, evaluation, and treatment.

KINES 532 Pathoetiology of Musculoskeletal Injuries (3)

This course is designed to provide the student with an in-depth understanding of the Pathoetiology of common musculoskeletal injuries. The pathoetiology of injuries will be approached from physiological, mechanical, and neuromuscular perspectives. The pathoetiology of injuries to bone, cartilage, ligament, muscle, tendon, and nerve will be explored, as will the processes of inflammation, tissue healing, and pain perception. Mechanisms of injuries to specific structures (lateral ankle sprains, ACL ruptures, intervertebral disc herniations,...) will also be studied extensively. Analysis of normal and abnormal movement mechanics as they relate to injury mechanisms will be discussed related to common athletic endeavors such as running and throwing. Clinical applications relating the pathoetiology of injuries to injury prevention, evaluation, and treatment strategies will also be explored. In addition to course lectures, an extensive reading list will be used to facilitate students’ knowledge with the current literature related to injury mechanisms. Evaluation of student achievement will be based on written examinations, a literature review paper, and an oral presentation. This
The course is targeted towards athletic health care professionals (athletic trainers, physical therapists,...) and those interested in orthopedic injury research. A thorough background in gross musculoskeletal anatomy and common musculoskeletal injuries are prerequisites for this course. The course is expected to have an enrollment of approximately 10-15 students and will be offered every other spring semester.

**KINES 540 History of Sport: Cultural and Social Dynamics (3)**

This seminar explores the literature, methodologies, theoretical challenges, and research questions confronting the field.

**KINES 540 History of Sport: Cultural and Social Dynamics (3)**

The History of Sport: Social and Cultural Dynamics explores the significant literature, key methodologies, and major questions currently confronting scholars of sport and leisure. The class will survey a variety of national sporting cultures and a wide range of topics.

Students will read works in major research areas in the field. They will debate arguments and issues raised in those readings. They will write critiques of their readings. Students will undertake several research expeditions. The expeditions familiarize the students with the resources available at Penn State and other libraries and archives. The research expeditions also introduce them to the scholarly tools necessary for undertaking research in the social and cultural dynamics of sport. They will also produce a primary-source based research paper on a topic that they select in consultation with the professor.

This course seeks to prepare graduate students to explore the history of sport. The course also seeks to develop the basic academic skills necessary for success in scholarly endeavors. Students will read, debate, and write. Writing assignments include journal article summaries, book critiques, and a research paper. The completed research paper should serve as a platform for producing a conference presentation and/or journal publication.

Effective: Fall 2011

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**KINES 565 Neurophysiological Basis of Movement (3)**

The basic understanding of neurophysiological structures and mechanisms involved in the generation of human voluntary movement.

**Neurophysiological Basis of Movement (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1997

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**KINES 566 Psychophysiology of Movement (3)**

Basic concepts and principles of psychophysiology and their application for analyses of human movements.

**Psychophysiology of Movement (3)**
KINES 567 (PHSIO 567) Advanced Exercise Physiology (3) Physiological changes during exercise with emphasis on the effects of physical conditioning and training.

Advanced Exercise Physiology (3)

KINES 574 Modeling in Biomechanics (3) Examination of the philosophies and tools used in biomechanical modeling and the insights into the musculo-skeletal system these provide.

KINES 574 Modeling in Biomechanics (3) It is the objective of this course to introduce the student to the following:
- the philosophical principles which underpin modeling in biomechanics
- the tools used in biomechanics for modeling
- key models developed in biomechanics explaining aspects of human movement

At the end of the course students should have a good understanding of how models are used in biomechanics, and how they contribute to a greater understanding of the mechanisms underpinning human movement. Students should have attained the skills that are necessary for them to start formulating their own models of aspects of human movement.

The course will provide an introduction to the relevant philosophical issues when using models to analyze human movement. The software tools which can be used for the development of models will be studied. The basis for simulation models are the equations of motion of the system being studied, techniques for deriving and solving these equations will be reviewed. Muscles provide the forces which generate human movement, so the properties of muscles and their modeling will be examined. The control of simulation models relies on theories from optimization, and these techniques and their implementation will be studied. Human movement can take many forms, and models which cover various aspects of human movement will be examined including walking, running, reaching, throwing, and jumping.

The course is intended for graduate students and is well suited for students specializing in biomechanics or bioengineering, but may also be relevant to students studying motor control, and sports medicine. Students will be evaluated via three tests, presentations made in class, a project, and a final examination.

KINES 575 Experimental Methods in Biomechanics and Motor Control (3) Introduces the theory and practice behind the primary experimental methods used in biomechanics and motor control.

KINES 575 Experimental Methods in Biomechanics and Motor Control (3) Biomechanics and motor control share a common methodology for recording and analyzing human movement. This course is designed to introduce students to the theory and practice behind the primary experimental methods used in biomechanics and motor control. At the end of the course students should have an increased understanding of the experimental methods used in biomechanics and motor control, and experience at implementing these methods. Topics to be covered include: signal processing, electromyography, motion analysis, force measurement, anthropometry, joint kinematics in two- and three-dimensions, joint kinetics, modeling, error propagation, and scaling and dimensional analysis.

Lectures will be used to introduce students to the theory behind a measurement technique. Readings will be used to provide supplementary examples of how these techniques are applied in the analysis of human movement. The techniques will be illustrated with MATLAB routines, with data sets provided so the students can experience how the data must be manipulated to provide meaningful results. Assessments will focus on students understandings of the techniques, their implementation, and interpretation of their output.

The course will provide a solid foundation for students wanting to understand how the data they are reading about has been produced, and the limitations in such data. Students will also have the background required to become independent in their data collection and processing in the analysis of human movement in both biomechanics and motor control.
Evaluation will include exams, class presentations and a portfolio. It is anticipated that this course will be offered every spring semester with a maximum enrollment of 15.

KINES 588 Scientific Writing in Kinesiology (3) Instruct students in writing grant proposals, abstracts, manuscripts, and effective presentations in their respective scientific fields of study in Kinesology.

KINES 588 Scientific Writing in Kinesiology (3)

This course is intended to assist graduate students in writing grant proposals, abstracts, and manuscripts, as well as preparing effective presentations in their respective scientific field of study within the discipline of Kinesiology.

Course objectives are to:
1. Increase technical proficiency in scientific writing vice a vers a grammar, sentence structure, formatting, etc.
2. Promote the ability to write effective specific aims, hypotheses, and background statement portions of a grant proposals
3. Understand the formulaic approach to writing effective scientific abstracts and manuscripts
4. Expand the ability to prepare and present effective oral communications using a Power Point format
5. Develop an understanding and appreciation for the peer review process associated with grant proposals and manuscripts

Evaluation will be based on grading of the following brief writing assignments: a manuscript abstract, the Introduction section of a manuscript, the Specific Aims page of an NIH-style grant proposal, and a set of Power Point slides for an abbreviated oral presentation.

The course is to be offered every fall semester. Enrollment is limited to Kinesology Department graduate students.

LABOR 966 The Law of Employee Benefits (3) Employe-provided pension and health care programs play a critical role in the lives of individuals, families, and communities. They also affect corporations, financial markets, and the economy as a whole. Employee benefit programs are, in short, an important staple of modern law practice. This course surveys the Employee Retirement Income Security Act and relevant portions of the Internal Revenue Code. Classes examine what benefit plans must do regarding reporting and disclosure, accrual, vesting, funding, and fiduciary standards. The course covers health care reform, the shift from defined benefit to defined contribution programs, and the effect of stock market volatility on benefit programs. Throughout the semester, students examine the policy goals underpinning federal benefits law. The course surveys major issues in ERISA litigation, including that statute’s claims and remedies provisions, as well as its preemption of state law.

Labor & Global Workers' Rights (LGWR)

LGWR 510 International Labor Law (3) Seminar exploring international labor law, including its standards, reviewing bodies, procedures, information sources, remedies, and overall strengths and weaknesses.

LGWR 510 International Labor Law (3)

Because globalized production systems call for globalized rules for workplace rights, a body of international labor law is rapidly developing. Designed principally for global labor activists, this course equips students to evaluate the role that international labor law -- its sources, participants, mechanisms, and remedies -- plays in the promotion of labor rights in the global economy. A centerpiece of the course looks at the International Labor Organization, whose complex processes introduce students to the generally "soft" rules of international workplace regulation. Beyond the ILO, the course looks at other bodies -- some global, others regional or bilateral -- that require or encourage compliance with decent working standards. It also addresses how private parties can create either voluntary "codes of conduct" or negotiated framework agreements spelling out labor rights. Across all of these topics, students take up cases covering the broad range of labor struggles (affecting unions, children, women, immigrants, forced laborers, etc.). Critical to the course is the student's gaining familiarity with the surprising variety of information available on working conditions around the globe.

As the course progresses, students are asked to formulate opinions on which international labor law forum holds the greatest potential to help with selected worker rights issues in selected countries. Students will review evidence suggesting that labor activists make their best use of international labor law when they link legal action to outreach, education, research, and "on the ground" organizing to enhance chances for success.

LGWR 520 Global Workers' Rights (3) Seminar course exploring the issues of work and workers' rights in the global economy.

LGWR 520 Global Workers' Rights (3)

This course examines the multiple debates around the topic of workers' rights: taking political and social perspectives and linking them to contemporary debates and proposals to enhance and/or strengthen workers' rights in Multinational Corporations (MNCs) and Global Value Chains (GVCs). The course combines an initial discussion of both the nature and the breadth of workers' rights, both in terms of philosophical debates and institutional policy parameters. The course then examines how workers' rights have been defended through strategic corporate research and campaigns.

The course will analyze the extent to which the legal grounding of workers' rights comes into harmony, or perhaps discord, with the actual state-based institutions that are said to implement labor laws and monitor their compliance.
The course will also look at how workers' rights and labor standards are continuously challenged by MNCs and their supplier firms, especially in light of the hegemony of competition and economic liberalization of the present age. Taking cues from such developments, the course looks at how certain theories and perspectives may assist students in understanding more acutely how the gradually changing economic and industrial structures and production-distribution regimes impact on workers' rights. Answering this question will be done by examining recent theories derived from economic sociology and contemporary industrial relations, especially those that look at how GVCs impact lead firms, supply firms, states, workers and worker organizations. Specifically, the course will look at how workers' rights are impacted by types of foreign investment and types of economic upgrading processes taking place in developing countries and often being propelled by capital fractions that are headquartered in the industrialized world. The last segment of the course will explore labor solidarity in GVCs. It will pay particular attention to how strategic corporate research can inform international solidarity campaigns.

LGWR 596 Individual Studies (1-9) Creative projects, including nonthesis research, that are supervised on an individual basis and which fall outside the scope of formal courses.

LGWR 894 Capstone Experience (3) Supervised, professionally-oriented student activities that constitute the culminating experience for the program.

LGWR 895 Internship (1-6) Supervised, professionally-oriented, off campus, non-group instruction, including field experiences, practicums, or internships.

The Labor and Global Workers' Rights (LGWR) internship aims to provide MPS in LGWR students with hands-on experience in labor and global workers' rights. The internship will build and reinforce the students' skills by enabling them to apply what they have learned in the classroom to a real-world labor and global workers' rights setting. As the MPS in LGWR is a professional degree, an internship in a real-world labor and global workers' rights setting is critical to students' academic and professional success.

Students complete their internships with US or international labor unions or a labor-oriented organization such as a worker center, labor NGO, or labor research institute. Through the internship, students will learn about priorities, policies and practices that these organizations have regarding workers' rights and/or international labor issues. Students may also gain insight, for example, into the challenges that American unions have with building working relationships and alliances with unions in other countries while also addressing global dynamics affecting working conditions and workers' rights.

Prior to the beginning of the internship, students will work with their internship adviser to develop individualized learning objectives. These learning objectives will shape a student's experience at the internship site and the types of projects the student will complete. The learning objectives will also provide the students with a metric by which they can evaluate their effort and performance.
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**Landscape Architecture (LARCH)**

**LARCH 400 Introduction to Design and Theory (IUG) (5)** Introductory landscape architectural design and applied theory for IUG students.

**Introduction to Design and Theory (IUG) (5)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Summer 1998  
Prerequisite:  
Concurrent: LARCH 400A  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**LARCH 414 Design and Theory V: Advanced Landscape Architectural Design (5-15)** Review of landscape architectural theories and issues; supports development of comprehensive design study and/or independent honors (Thesis-Based) design projects. LARCH Majors only.

Fourth- and fifth-year design studios are designated "depth" studios. Each studio is aligned with one of the department’s associated research centers or pursues special topical content and continues the development of site-scale planning and design skills for landscape architecture students with larger and more complex sites and programs. Students select a topic from the range of options. Students may choose to take a given topic on a maximum of two occasions.

Topics are related to issues that have been introduced in previous studios and are as varied as possible from studio to studio. This allows students to select a topic of interest to explore with great intensity and detail. The studio alternatives offered each year are based on faculty expertise and student interest, and are chosen by the department head’s review of faculty proposals. To date, studio topics have ranged from historic preservation to recreational landscapes, urban ecology to community planning. The type of project is determined on an individual basis, and will be rigorous and require a high level of depth of thought and a sophisticated product.

Project types include regional master planning, large-scale site planning and medium-scale community/housing design. The design issues emphasize urban form, community identity and open-space systems in the United States as a follow-up to urban patterns experienced during the student’s previous study abroad. The project types may include such topics as inner-city locations with mixed-use and complex programs that progress from research and planning to site-scale design. Often, students work with an actual client, such as an urban planning commission or a city economic development entity, etc. Issues of urban form as a setting for significant practice opportunities are emphasized. Locations such as brown fields, urban entertainment districts, waterfronts, housing infill, etc., form the basis for design response in context.

Course Objectives:

- To develop an in-depth understanding of one or another aspect of landscape architecture.
- To be exposed to the rigor and challenges of developing and implementing one’s own design expertise in the context of a specific environmental concern.
- To exercise the design principles, technological tools and communication strategies developed during the course of the specific design studios.

**LARCH 424 Design Theory Seminar (3 per semester/maximum of 9)** Inquiry-based reading and discussion of design theory literature relevant to contemporary landscape architecture issues. Topics vary each semester.

**LARCH 424 Design Theory Seminar (1-3)**

LARCH 424, Design Theory Seminar, is a companion to the depth studios, LARCH 414. However, unlike the seminars offered during second and third years, LARCH 424 is not tied topically to any particular depth studio. Instead, this seminar provides a vehicle for rigorous and structured exploration of the theoretical and philosophical issues that face landscape architectural designers and planners. The seminar is a small group setting where directed readings, independent research and reflection are employed to explore the context of contemporary design.

The Pennsylvania State University
These seminars, offered to fourth- and fifth-year students, enable professors and students to take their investigations to greater depth. Seminars are offered by different professors each semester and the content is expected to be somewhat aligned with the faculty member’s research and scholarship or pursues special landscape architectural topical content of the faculty’s choosing. Students select seminars from the range of options offered. This allows students to select a topic of interest to explore with great intensity and detail. Students are required to take up to three seminars to achieve a minimum of three credits.

Topics are related to issues that have been introduced in previous studios and seminars and the department ensures that students have access to the widest range of topics. The seminar alternatives offered each year are based on faculty expertise and student interest, and are chosen by the department head’s review of faculty proposals. Seminar topics related to our research centers include historic preservation, urban ecology, community planning and watershed stewardship. From time to time topics independent of our research centers, such as the impact of public policy on design or the impact of technology on design and planning, will be addressed. The type of seminar outcome is determined by instructors on an individual basis, and will be rigorous and require a high level of depth of thought and a sophisticated product.

Course Objectives:
• To further develop an in-depth understanding of the theoretical or socio-political context for one or another aspect of landscape architecture.
• To challenge students to articulate their own values in the context of a specific environmental concern.
• To examine the means by which designers reconcile their own, their clients’, and society’s values in the pursuit of particular design or planning goals.

LARCH 450 Geodesign: Geospatial Technology for Design (3) Interactive geodesign and digital design studio.

LARCH 450 Geodesign: Geospatial Technology for Design (3)

This course addresses the role of continually evolving information technologies in landscape architectural research and practice by reference to long legacy of theoretical contributions from the field that have sought to reconcile and benefit from integrating the sciences of society and environment with art, design, and planning. This interactive digital design course is an advanced geodesign methods and principles class that applies digital tools to landscape research, modeling, analysis and design. This course presents a digital process for analyzing, managing, and ultimately designing landscape systems by allowing students to inventory, analyze and evaluate complex spatial datasets. Students will learn to critically evaluate and implement the interplay between various factors and design alternative futures.

Lectures will introduce key geodesign principles and techniques. The goal is to investigate an array of geospatial software as a powerful design tool in a broad and integrated manner for all the activities of the landscape architect, designer, planner and architect. Using a variety of geospatial and digital tools, students will develop a process to study, analyze, and plan landscape systems. They will utilize activities from each lesson to develop primary and alternative strategies for their proposed project. The problem-based approach used by this course will encourage cross-cultural contexts for student projects.

Geospatial design computing technology enables many alternate approaches to problem-solving, so that students will customize their own learning experiences within the concrete structure of the course. This course brings advanced geospatial and digital analysis and evaluation into the design process, where concepts and ideas are vetted for suitability against a wide array of physical and social, place-based information. This on-the-fly suitability analysis provides a framework for design, giving landscape architects, architects, land-use planners, and others involved with design the tools to directly leverage geospatial information within their design workflows.

LARCH 497B Advanced Digital Landscape Modeling and Rendering (3) As digital 3D modeling software has become more powerful and easy to use, it is now possible for the average student or professional to create stunning, photorealistic renderings of complex scenes that were once only possible by enlisting the most sophisticated Hollywood movie studios or professional computer graphics illustrators. As impressive as these computer renderings are, the quest for photographic realism has resulted in the loss of one of the most important qualities of traditional design drawings and renderings, imperfection. It’s the “imperfections” (or perhaps subtle variations) in nature and the built environment that helps produce beauty. Perhaps it’s the imperfection and ambiguity in traditional rendering techniques that helps make them so appealing and effective for visual communication.

LARCH 499E (IL) People and Protected Areas (3) LARCH 499E is a three-credit seminar that aims to introduce students to key issues associated with communities, community design, biodiversity conservation, and the interface of people and conservation in the vicinity of Udzungwa Mountains National Park in south-central Tanzania. The format of the course is reading and discussion, where students read assigned literature and then contribute to discussions led by faculty, both to demonstrate their understanding of the reading assignments and to begin to explore key issues introduced by those readings. Students also write two papers, the first examining the interface of rural land use planning, community design, and biodiversity conservation; and the second focusing on biodiversity conservation in the context of human settlement near Udzungwa Mountains National Park. Student evaluation is based on seminar participation and the two papers.

LARCH 499F (IL) Community Design in the Vicinity of Udzungwa Mountains (5) LARCH 499F is a five-credit course that focuses on student research projects associated with communities along the eastern boundary of Udzungwa Mountains National Park. We have purposefully maintained a general definition for the course to allow students to design projects that best suit their interests and skills. For example, some students may focus on evaluating existing village configurations and propose new designs that help villagers better meet their daily needs. Other students, in turn, may focus on developing a more marketable park that attracts larger numbers of visitors who stay in or near the park for longer periods of time - generating more income that ultimately will find its way, in part, to local communities.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

LARCH 499G (IL) The Contribution of Service-Learning to Students and Community (1) LARCH 499G is a one-credit course designed to enable students to reflect on what for most will be their first opportunity to visit and work in rural East Africa. It involves the development of daily journals to record reflections on their evolving awareness of Tanzania and the challenges that people and conservation face in this less-developed country. The journals provide a foundation of reflections about one or more issues that interest each - maybe (though not necessarily) something close to the focus of the specific education abroad experience involved (e.g., the relationship between people and protected areas in south-central Tanzania), maybe international development in general, or maybe another topic. The journals also should be important personally: In all likelihood, this six-week period will expose students to places, people, and challenges that they have never seen in person.

The Contribution of Service-Learning to Students and Community (1)

General Education: None

LARCH 500 Environmental and Ecological Conditions in Regional Landscape (1) Landscape architectural field trips within the Centre Region.

Environmental and Ecological Conditions in Regional Landscape (1)

General Education: None
LARCH 501 Research and Writing in Landscape Architecture (3) Landscape architectural research methods and writing techniques.

LARCH 502 Intellectual History and Theory of Landscape Architecture (3) Introductory theory seminar covering the intellectual history of landscape architecture and theoretical contributions from related disciplines.

LARCH 510 Graduate Seminar in Landscape Architecture (3) Landscape architectural theory exploration through readings and discussions.

LARCH 515 Design and Theory I: Introduction (5) Introductory landscape architectural design and applied theory for MLA students.

LARCH 520 Design and Theory II: Introduction to Issues of Place (5) Studio design with a focus in addressing issues of nature and culture.
LARCH 520 is the second of a four-class sequence of design studios at the core of the professional MLA design program. The course follows LARCH 515 and continues to develop the fundamental concepts and basic skills of landscape architectural design. The particular emphasis of this class is an introduction to site analysis encompassing both natural and cultural elements of place. The studio project types are small to moderate in scale and have basic programs. In many cases, site design projects include community projects (i.e. parks) with real human issues and sites. Group discussions and critiques will be important activities in the studio.

This course builds upon two previous classes: the ideas explored in LARCH 515 such as the basic design elements (landform, vegetation, structures), and the issues in LARCH 241 of landscape design and the ecology of site, via a series of studio projects, charrettes (intensive applied workshops) and field trips. LARCH 520 will engage students with design challenges of real sites in the State College/University Park community. Students will be challenged to develop the comprehensive understanding of site and activities (program) required to become an effective landscape architect. Included in the most important parts of that comprehension are natural, social, historical, and aesthetic site conditions; functions, activities and program requirements; site and community context; and relevant design concepts, theories and examples.

The subsequent challenge for students will be the development of design processes necessary to integrate site and program understandings into unified, successful design.

LARCH 530 Design and Theory III: Landscape Systems (5) An introduction to regional planning, management, and design.

LARCH 530 Design and Theory III: Landscape Systems (5)

LARCH 530 considers the broader landscape and systems within the landscape. There are two very good reasons to learn to work at the broader landscape scale: to make informed planning, design and management recommendations at that level, and to enlighten site-scale design with a regional perspective. Students begin exploring ways to understand and address issues of regional context before focusing on local-scale site design in the spring semester. Projects include an emphasis on regional analysis, site and program analysis, and site design in the regional context. Studio work involves research and report writing and medium- to large-scale projects where site design and program are directly influenced by regional factors. Topography, geomorphology, land use, transportation, regional ecology, demographics, landscape history, visual analysis, etc., are introduced, all bound into current technological formats using such tools as Geographic Information Systems.

Students explore ideas about landscape-scale conservation, linkages and recreational programming - important types of regional-scale work with which landscape architects are involved. They apply knowledge of the landscape in considering public planning, design and management interventions, including exploration of alternatives for landscape conservation and recreation. Students become involved, through community outreach projects, with interactive and real (e.g. sometimes messy) public dialogue that may help build community-wide enthusiasm for a landscape project of regional significance.

LARCH 540 Design and Theory IV: Site and Community Design (5) Large site and Community Design.

LARCH 540 Design and Theory IV: Site and Community Design (5)

LARCH 540 directly references the understanding of the regional context from the preceding studio courses to take
students into community master planning issues. An introduction to those issues and the issues of sprawl and landscape history then allows a transition to community form and housing-type topics. In this class, students gain an understanding of designing communities and everyday human habitat - at several scales, including the interrelationships of natural, cultural and economic factors on the past, present and future development of communities. They develop awareness that even small, individual site design requires an understanding of larger environmental and cultural contexts. To this end, they learn to assess physical and cultural geographies at regional and local scales and their implications for community design at the site scale.

Language and Literacy Education (LL ED)

LL ED 400 Teaching Reading in the Elementary School (3) Introduction to the reading program; acquaintance with materials and techniques; observations of reading instruction; correlation with human growth and development.

LL ED 400 Teaching Reading in the Elementary School (3)

LL ED 400 is intended to help teacher candidates become knowledgeable users of theory and language about language, literacy and culture; and to think through instructional problems thoroughly, using multiple sources of information to experiment with alternative solutions. Dealing specifically with reading, we recognize that text goes beyond print texts to include multimodal visual, auditory, digital, movement, and artifactual texts. In LL ED 400, candidates learn to understand how children develop as readers and users of literacies in and out of school. Candidates learn how to teach in ways that support children’s successful development and uses of multiple kinds of literacy, including reading. Literacy teaching is both an intellectual and practical matter in which teachers work with students in ways that recognize the complexities of language and its social uses, learning and its cultural contexts, and schooling as organizational phenomena. Children enter schools with multiple types of literacy knowledge and cultural experiences. Coming to understand these complexities requires the coordination of both theoretical awareness and applied knowledge. Candidates’ practice is developed as they learn to address the puzzles children present as they construct their knowledge of language, literacy, and literature in various social situations. Developing practical strategies to teach literacy requires a dedication of head, hand, and heart to treat all people with dignity, acknowledging the contributions of all cultural groups and respecting diversity as it honors ideals of social justice.

In LL ED 400, teacher candidates develop a repertoire of organizational, instructional, and evaluative strategies that are based on research and best professional practices. Candidates work on projects independently and in collaborative groups. Content is presented by the instructor through a combination of lectures, weekly readings and reflections on readings, class discussion, activities and demonstrations, and viewing and analyzing video. Projects include an analysis of children as readers and curriculum planning.

LL ED 400 is part of a block of courses in a PSU teacher education program that is unified by the basic set of principles supporting the development of a broader and more inclusive understanding of texts, children, and communities.

LL ED 401 Teaching Language Arts in Elementary School (3) Principles, problems, materials, and techniques involved in teaching speaking, listening, writing, and reading in the elementary school.

LL ED 401 Teaching Language Arts in Elementary School (3)

The purpose of LL ED 401 is to acquaint teacher candidates with theories and practices of teaching writing. Candidates are immersed in the study and experience of workshop and strategic models of writing instruction. Basic goals of this course are to help candidates to use language well and thoughtfully concerning writing instruction, literacy, literature and culture; and to think through instructional problems thoroughly, using multiple sources of information to experiment with alternative solutions. We also expect candidates to understand the roles which culture plays in literacy practices, literature, identifications of “ability,” and schooling; to learn how people function effectively in groups; and to develop a repertoire of organizational, instructional, and evaluative strategies.

LL ED 401 is part of a block of courses in a PSU teacher education program that is unified by the basic set of principles supporting the development of a broader and more inclusive understanding of texts, children, and communities.

LL ED 402 Teaching Children’s Literature (3) Survey of children’s literature with an emphasis on the importance of literature in the development of the elementary school curriculum.
LL ED 402 Teaching Children's Literature (3)

The purpose of LL ED 402 is to familiarize teacher candidates with different theories and practices of teaching literature. Candidates will be immersed in the study and experiences of literature and strategic models of literature instruction. Understanding that belief systems inadvertently determine the models of literature instruction educators adopt, LL ED 402 asks candidates to be mindful of the diverse nature of our communities, and encourages them to strive to create literate communities that respect, value, and encourage multiple modes of expressions. The basic course goals are to help candidates to understand the importance of story in all human lives; to exhibit a wide repertoire of flexible strategies for interpreting literature; to understand socio-cultural influences upon writing and literature; to know and be able to use basic reference tools and selection guides for research; to become familiar with different genres, diverse texts, and styles; to read for sequence and for secrets; to articulate responses to literature across a variety of media; to weave into the exploration of each of these goals a struggle to understand and to accept human difference; and to understand the role that literature plays in the school curriculum.

The course presents theories of teaching literature and models of literature instruction that place at the center socio-cultural practices typical of democratic literary communities. This requires knowledge of how literature and texts work in real life and in a variety of social and cultural contexts. Informed by research, standards and current practices, LL ED 402 exhibits the power of literature, the complexities of students’ learning and experiences with texts, and the problem solving character of teaching.

LL ED 402 is part of a block of courses in a PSU teacher education program that is unified by the basic set of principles supporting the development of a broader and more inclusive understanding of texts, children, and communities.

LL ED 412W Teaching Language Arts in Secondary Schools II (3) Exploration of language, literacy, and culture and development of curricular designs for teaching language arts in secondary schools.

This three-credit course addresses the theory, practice, and implications of teaching the English language arts at the secondary level. The course is the discipline-specific component of the Secondary Education block taken by majors in Secondary Education prior to student teaching. In this course, students explore issues in language, literacy, and culture and development of curricular designs for teaching language arts in secondary schools. Through in-class and out-of-class activities completed both independently and in collaboration, students read about, talk about, and practice teaching all of the language arts—reading, writing, speaking, listening, and thinking. Activities highlight ways of planning for instruction and ways of assessing student learning as teachers implement those plans. In addition, students will take up the professional issues facing beginning teachers of the English language arts—issues of professionalism and the teaching role, relationships with students, and how teaching can fit into a life. The course builds upon content developed in other courses in the major, including theories of reading, composition, media literacy, and pedagogy. Students engage in a variety of writing tasks both in support of developing course content and as a means of making their work public. This writing includes (but is not limited to) lesson planning, reflective writing on experiences both in the course and in related field experience, and the development of a professional portfolio. During class sessions, informal writing is used for a variety of purposes such as brainstorming, facilitating collaborative work, or framing discussion. Throughout the semester, students draft and receive feedback on a variety of portfolio components, which are revised and incorporated into a final version of the portfolio due at the end of the course. Portfolio contents vary according to instructor, but examples might include statements of educational philosophy, analysis of student writing from field experience, commentary on unit and lesson materials, reflective writing on reading and writing processes, and professional documents such as lesson plans and letters to mentors and potential employers.

LL ED 450 Content Area Reading (3) Study of reading skills and materials for specific content areas; diagnostic and instructional procedures for classroom teachers.

LL ED 450 Content Area Reading (3)

LLED 450 is designed to explore the roles of texts and literacies within the daily lives of middle school age students. We will examine both in-school and out-of-school literacy practices related to meaning-making in specific communities of practice. In doing so, we will work from a broader definition of "text" that includes print, images, sound, hybrid combinations and artifacts from popular culture. In school, we examine how literacies are involved in the learning of content, emphasizing how social practices of thinking in different ways about the world have been organized into school subjects and how teachers can help students to engage productively in those practices. Out of school, we look at the ways in which this age group uses text and other forms of literacy to make sense of and in their lives. Toward that end, we look closely at the media that they use and the types of texts that are produced for and by them. Although we honor the traditional practices of academic disciplines, we recognize how new texts and tasks ford those boundaries in order to pose and address school and everyday problems.

The basic goals of this course are to help teacher candidates to use language well and thoughtfully concerning literacy, text, and culture; and to think through instructional problems thoroughly, using multiple sources of information to experiment with alternative solutions. We also expect candidates to understand the roles that culture plays in literacy practices, texts, schooling and assessments of "ability"; to learn how people function effectively in groups; and to develop a repertoire of organizational, instructional, and assessment strategies.

This course considers how intermediate grades and middle schools are communities of practice that connect disciplines through the use of language and texts to make sense of the world. The communities surrounding schools influence these uses, and this course follows the students' learning outside the classroom and schools as well as within.

LL ED 462 The Art of the Picturebook 3 An in-depth study of picturebooks as art objects providing aesthetic experiences and contributing to our aesthetic development in literacy education.

LL ED 462 The Art of the Picturebook (3)

The Pennsylvania State University
The Art of the Picturebook explores a wide range of picturebooks with the idea that illustrations are visual art evoking thoughts and feelings. Because picturebooks provide aesthetic experiences and contribute to aesthetic development, they are rich and important sources for literacy education. This course provides opportunities to extend students’ repertoire of strategies for making sense of picturebooks, to deepen knowledge about picturebooks and the artists who create them, and to consider ways to help children become more sophisticated readers of picturebooks.

While picturebooks are often emphasized as integral to the literacy development of young children, they can be engaging and desirable for older children as well. Course topics include picturebooks for the very young, as well as picturebooks that could appeal to elementary and middle school children. Whether picturebooks appear relatively simple and straightforward or contain innovatively complex or metafictive design elements, close readings of them with an understanding of terminology offer opportunities to express and discuss reactions and interpretations. The Art of the Picturebook provides students a forum for exploring preferences, ideas, insights, and questions about selected picturebooks, along with curricular and pedagogical considerations. Course readings include interviews with illustrators, selections about creating picture compositions, and scholarly essays presenting theoretical perspectives and ideas about picturebooks as literature and art for children’s literacy development.

This course emphasizes that reading and interpreting picturebooks is an active, creative process that is socially, culturally, and historically situated. Authors and illustrators are influenced by culture, so their art reflects values of that culture, consciously or unconsciously. A reader’s experience with a picturebook is also influenced by cultural and social contexts in a given moment. Because engaging in aesthetic experiences is an active, creative process, reading picturebooks is, as Jane Doan (1993), author of Looking at Pictures in Picture Books, asserts, a form of play. The Art of the Picturebook approaches picturebooks as sources of deep play.

The course also provides opportunities to research selected illustrators, both for class discussions and an illustrator study project (e.g., a Wiki page). The culminating illustrator study project involves an in-depth investigation of a key children’s book illustrator and a process of sharing works-in-progress with classmates for collaborative editing.

LL ED 465 Fantasy Literature for Children (3) A study of fantasy literature for children looking at a variety of fantasy stories and examining them from different perspectives.

LL ED 465 Fantasy Literature for Children (3)

Fantasy Literature for Children explores a range of fantasy literature including literary fairy tales, toy fantasies, ghosts/horror/suspense, science fiction, reworked fairy tales, low fantasy, and high fantasy. This course will consider different rationalizations for fantasy literature and will examine some of the key stories that illustrate fantasy from different perspectives, such as literary, social, and psychological angles.

This course will look at, first, the beginnings of modern fantasy with the fairy tales of Hans Christian Andersen and Carlo Collodi’s classic, Pinocchio. Then the course reading will include ghosts and other supernatural fantasy stories, and "reworked" fairy tales, a current trend in fantasy literature. Despite of some scholarly debates on science fiction, that is, whether it should be categorized into fantasy or not, this course will consider science fiction as being similar enough to fantasy for it to be included. The course will also include a study of fantasy books currently popular with school-age readers.

Fantasy can be divided into two main groups: low fantasy and high fantasy. Several of the stories to be read in the course are perhaps best categorized as low fantasies, not because of what they are, but because they are not high fantasy, which has a mythic quality to it. High fantasy seems to go beyond the particulars of its story to explore the nature of good and of evil. Though high fantasies can be humorous at times, the overall tone is serious. Often characters are on quests and the stakes of success or failure usually involve saving the world from some great evil or preventing the tyranny of some powerful and evil ruler.

Reading the different types of fantasy literature and the literary critiques and analyses of those works, this course will be wrestling with the overall importance of those books in the lives of children by pondering imagination and its role in the lives of children throughout the course.

LL ED 561 Cultural Pluralism in Children's and Adolescent Literature (3) Reading/discussing literature from multicultural/critical multicultural lenses and how this impacts literacy.

Cultural Pluralism in Children's and Adolescent Literature (3)

LLED 561 is a critical exploration of literature that addresses multicultural issues and their functions in the classroom. Emphasis is on cultural diversity in children's lives. The course focuses on four main areas. The first of these areas revolves around the concepts of multiculturalism and critical multiculturalism and how they serve as lenses through which students can ask questions about society as represented in literature. It addresses what multicultural literature is, who writes multicultural literature, and how this genre of literature serves as a window into and a mirror of culturally diverse societies. Race/ethnicity, gender, class, disability and cultural authenticity in multicultural literature are discussed. The primary objectives of the course are to enable students to expand their strategies for reading culturally diverse literature, become familiar with resources related to multicultural literature, explore cultural, literacy and socio-political issues related to children's/adolescent literature and to consider the role that multicultural literature plays in a literacy curriculum.

Ldrshp Development (LEAD)

LEAD 501 Leadership Across the Lifespan (3) Analysis and application of models, theories and strategies for developing an individual's full leadership potential at different life stages.

LEAD 501 Leadership across the Lifespan (3)

LEAD 501 explores and analyzes the requirements for positive leadership of the self and others, recognizing the way people change along the way from early adulthood to old age. Students will be introduced to the various components of the self-leadership, including personal meaning, optimal experiences (flow), emotional intelligence, moral development, how a leader's (and his/her followers') life stream of biographic and demographic elements influence leadership processes, and followers' perceptions the leader's behavior. Students will learn how to display psychologically empowering positive leadership based upon information obtained through discussions, 360-degree and moral development leadership assessments, participation in field projects observing leadership "in vivo," analysis of relevant popular movies by applying theories of leadership and adult development, and readings. Emphasis in this course is placed on learning from the life streams of "real world" leaders to bring the material covered in the course. As the course progresses, new knowledge and skills are integrated into a more sophisticated framework for understanding positive leadership across the lifespan.

LEAD 519 (BUSAD 519) Developing Creative High Performance Organizations (3) This course focuses on how to create high performing organizations based on models provided by business, science and the arts.

LEAD (BUSAD) 519 Developing Creative High Performance Organizations (3)

Overview:
This course focuses on how to create high performing organizations based on models provided by business, science and the arts. We will examine the key assets that these disciplines bring and show how to apply them to business activities. For example, it has been shown that improvisational models from music are highly relevant to new product development. Course activities will include a discussion of the readings from relevant academic research in the business field. We will discuss the philosophy of aesthetics, analyze cases, and review original works. We will also listen to short lectures by practicing artists, musicians, actors, scientists, and writers. Together, these activities will help students to develop strategies to help their organizations attain higher levels of performance. This course is a graduate elective for MBA students and could also be taken by other students (such as Leadership students) if it meets their degree requirements.

The way the course will run:
This course will be run as a graduate seminar designed to maximize the learning of the members of the group including the instructor's. We will learn about each of the topics noted above through a variety of means. Our interaction will include general discussions, lectures, case discussions, exercises, small group meetings, and on-line chats. We will have invited speakers for the class representing the arts, music, science and business.

LEAD 555 (BUSAD 555) Full Range Leadership Development (3) Development of behavioral skills associated with outstanding leadership of individuals, teams, and organizations through advanced information technology, experimental
LEAD (BUSAD) 555 Full Range Leadership Development (3)

Leadership is one of the world's oldest preoccupations. Since the beginning of civilization, prophets, kings, rulers and managers have struggled to find answers to an important question: Why do most leaders or managers elicit merely competent performance from their followers, while a select few inspire extraordinary achievement? Given increased globalization, diversity, restructuring, e-business and innovation in today's business environment, finding answers to this question is important for maintaining organizational competitiveness.

The purpose of this course is to provide answers to this question by identifying traits and behaviors associated with outstanding leaders, explaining how they get results, and why their leadership often exceeds all expectable limits. This course is designed to introduce students to a) behaviors associated with outstanding leadership, b) social learning and cognition in organizations as a context to promote outstanding leadership, and c) leadership development as a strategic intervention to enhance individual, group, and organizational motivation and performance.

The course will be run as a graduate seminar. We will interact through Web site technology, general group discussions, team projects, lectureettes, case discussions, exercises and videos. Class sessions will focus on issues raised by the readings, cases, and issues relevant to students' organizational experiences. A portion of the class time may be set aside for the coordination of team projects.

LEAD 557 Leadership Models and Methods (3)

LEAD 557 provides masters'-level graduate students with an initial understanding of the process of research methods, particularly within leadership and management-related disciplines and in organizational contexts. Students will survey a variety of leadership models and their application to leadership research and practice. They will learn how to evaluate and design research studies and apply them in organizational context in their consulting work, debate ethical and philosophy of science issues, and solve focused organizational problems by applying the scientific method. Emphasis in this course is placed on "learning by doing" in order to gain knowledge of how leadership theories are formulated, how data are analyzed to test theories, and how conclusions about data and theory are drawn. Students learn by critiquing a variety of key leadership models, identifying real organizational problems and applying the skills of theory and hypothesis formulation, measurement, sampling, and study design.

Students learn techniques of data collection and analysis using SPSS (Statistical Package for the Social Sciences), and how to write clear and concise research papers. As the course progresses, new knowledge and skills are integrated into a more sophisticated framework for understanding how leadership models and methods can solve organizational problems.

LEAD 562 Strategic Leadership (3)

Executive-level leadership of larger systems and organizations. Impact of developing human, intellectual, social, structural, financial and reputational capital as strategic tools.

LEAD 562 Strategic Leadership (3)

LEAD 562 explores and analyzes the requirements for effective strategic leadership in organizations operating in today's technology-driven environments. Students will be introduced to the various elements of the strategic leadership system, including organizational context/environment, leader's life stream of biographic and demographic elements influencing leadership, and followers' perceptions the leader's behavior. Students will learn how to display outstanding strategic leadership based upon information obtained through discussions, field-based case studies, and readings. Discussions will be conducted face-to-face, email and/or on-line ANGEL bulletin board discussions. Emphasis in this course is placed on learning from "real world" senior managers/administrators to enhance the practically and usefulness of the material covered in the course. As the course progresses, new knowledge and skills are integrated into a more sophisticated framework for understanding strategic leadership.

LEAD (BUSAD) 582 Social Entrepreneurship and Community Leadership (3)

This course will provide an opportunity for students to explore concepts of developing and leading businesses that create social value.

LEAD (BUSAD) 582 Social Entrepreneurship and Community Leadership (3)

This course uses entrepreneurial and leadership skills to craft innovative responses to social needs. Entrepreneurs are particularly good at recognizing opportunities, exploring innovative approaches, mobilizing resources, managing risks, and building viable, sustainable enterprises. Entrepreneurial skills are just as valuable in the social sector as they are in business. Social Entrepreneurship aims at social impact but does not exclude economic wealth creation. Therefore it is not limited to the non-profit sector. Despite a sustained economic boom in this country, numerous social problems remain and some seem to be getting worse. The course will focus on introducing business leadership and entrepreneurship principles to both profit and non-profit organizations whose products and services are designed to create social value.

Learning Design & Tech (LDT)

LDT 505 Integrating Mobile Technologies into Learning Environments (3) Research on learning with mobile computers and models for mobile computer integration for K-12 schools, community organizations, and universities.

Integrating Mobile Technologies into Learning Environments examines how people use and learn with mobile computers in their everyday lives around the world.

The focus is on the uses and educational possibilities of mobile computers to serve as tools that can support people in various learning environments (such as schools, colleges and universities, training and professional development, museums, libraries, homes, and workplaces).

Topical areas are covered that build from empirical studies about how people learn with mobile forms of computing: (1) how people use mobile computers in their everyday lives, (2) key theoretical perspectives on how people learn with mobile computers, and (3) research findings on integrating mobile computers into the design of learning environments.

In addition to activities for the whole class, students select one course strand to support their own interests and final project. The course strands are tailored to students’ interest and can include (1) integrating mobile computers to support families and young people, in and out of school, (2) integrating mobile computers to support adult learners in higher education (includes distance education), (3) integrating mobile computers to support workforce development, vocational education, professional development, certification achievement, and on-the-job training, and (4) integrating mobile computers within community-based organizations, personal hobbies, and cultural institutions.

Linguistics (LING)

LING 402 Syntax I (3) Principles of grammatical analysis in the generative framework; an overview of syntactic structures across languages.

LING 402 Syntax I (3)

(BA) This course meets the Bachelor of Arts degree requirements.

The aim of this course is to provide students with the background needed to understand advances in modern generative syntactic theory and to encourage them to do creative and informed research in this area on English or other languages that they might know. The course provides a historical overview of the development of generative syntax. We explore in depth a number of topics that challenge any syntactic theory and we attempt to propose testable hypotheses concerning language structure.

LING 404 Phonology I (3) The analysis of the sound systems of human languages; focus on common phonological processes across languages and on phonetics-phonology interface.

LING 404 Phonology I (3)

(BA) This course meets the Bachelor of Arts degree requirements.

This course is about sound patterning in language. In particular, we will learn how human speech sounds are produced and how they function together as a system. We will learn the International Phonetic Alphabet applied to English. We will discuss phonological data from many different languages to seek common phonological processes that occur despite the apparent surface diversity of languages. We will do extensive work on phonological problems in order to master basic phonological analysis.

Bachelor of Arts: Social and Behavioral Science
Effective: Fall 2001

LING 429 (PSYCH 426) Language and Thought (3) Relations between language and cognition; cognitive implications of normal and impaired language development; cognition and bilingualism.

LING (PSYCH 426) 429 Language and Thought (3)

(BA) This course meets the Bachelor of Arts degree requirements.

Is language a special and uniquely human ability that develops and functions independently of other cognitive processes? Do individuals who speak different languages also have different concepts about the meaning of objects and ideas? Does language development depend on exposure to spoken language? In this course we will examine the relation between language and thought by considering evidence on language and cognition in both children and adults. Topics to be covered include the typical development and use of language as well as language and cognition in individuals whose language and/or cognition is impaired in some form. The latter include individuals with aphasia who have sustained brain damage following stroke or head injury, schizophrenics whose language reflects aspects of their disorder, children...
diagnosed with Williams Syndrome who appear to have good or even precocious language abilities in the face of severe cognitive impairment, and Alzheimer's patients in whom semantic memory has begun to deteriorate. The course will also discuss the acquisition of sign language among deaf individuals and the consequences of bilingualism for children raised with two languages and for adults with proficiency in more than a single language.

The purpose of this course is to provide a survey of current scholarship on the relation of language and thought, including a review of recent developments in the primary literature. The necessary background is covered in introductory Psychology and Linguistics courses, which serve as alternative prerequisites. Students will learn about the consequences of typical and impaired development for relations between cognition and language ability. It is distinguished from PSYCH 457, Psychology of Language, by a focus on the implications of language, language development, and language impairment, for cognitive processes. It covers some topics also addressed by current courses in Linguistics and in Communications Sciences and Disorders, but is distinguished from those courses by its focus on perspectives and theories from cognitive psychology. This course may be used toward the 400-level PSY requirements of the PSYBA and PSYBS majors, and toward the PSY minor. Students typically will be assessed on the basis of class participation and discussion (20%), four papers (total 60%), and an in-class presentation based on reading original research literature (20%). The course typically will be offered once each year at the University Park campus with an enrollment limit of 50.

LING 449 Semantics I (3) The study of meaning in human language; methods of analysis; study of sense, reference, compositionality, quantification, presupposition, and sentence-level meaning.

LING 449 Semantics I (3)
(BA) This course meets the Bachelor of Arts degree requirements.

This course examines our best understanding of how humans produce and understand utterances to have particular meanings. This course examines lexical semantics, which is concerned with word meaning, phrasal semantics, which examines phrase meanings and with pragmatics, the study of meaning in contexts. Because meanings cannot always be built up or deduced from the combined meaning of smaller elements, students will attempt to divulge the semantic principles at work in human language through a wide variety of problems and activities.

LING 457 (PSYCH 457) Psychology of Language (3) Overview of psychological research and theory on language processes, including speech perception, word recognition, meaning representation, comprehension, and language acquisition.

LING (PSYCH) 457 Psychology of Language (3)
(BA) This course meets the Bachelor of Arts degree requirements.

How do we process language? Why do we easily adjust to a speaker with a foreign accent? How do young children come to speak the language to which they are exposed? Why is it difficult to learn a second language as an adult? This course focuses on the cognitive processes engaged by language use. Topics to be covered include speech perception, word recognition, representation of word meaning, comprehension of sentences, spoken production of words and sentences, and first and second language acquisition. In addition, the role of language in the study of thought and the role of biological mechanisms in theories of language learning will be discussed, as well as ways in which research on the language of special populations (e.g., deaf signers, dyslexics, aphasics) can inform theories of language processing and representation.

The Pennsylvania State University
LING 493 Field Methods (3) Primary linguistic investigation of a language different from English; field work with a native speaker; data gathering; linguistic analysis.

(BA) This course meets the Bachelor of Arts degree requirements.

In this course, students work directly (in groups) with a native speaker of a foreign language with which no one in the class has any prior familiarity. The students will work to uncover the set of sounds relevant to the language in question by winnowing down possible sound contrasts made in human languages. They will begin to construct a lexicon (vocabulary) built with a phonetic alphabet to discover how words are formed in the language. They will refine their techniques of questioning their research participant based on principles of linguistic field work. Finally, groups will present their findings for discussion and revision.

LING 494 Research Project (1-12) Supervised student activities on research projects identified on an individual or small-group basis.

Advanced topics in phonological analysis and theory.

**LING 504 Phonology II (3)**

Students in this course will examine the shift from rule-based to constraint-based theories of phonology with an emphasis on analyzing the shortcomings and paradoxes inherent in earlier approaches. At issue will be the search for a better understanding of how the phonological component continually interacts with phonetics and morphology in order to create optimal outputs. Students will analyze particular problems through reading various journal articles treating the same topic from different approaches. They will then evaluate the various approaches systematically. The goal of this course is to prepare students to do close readings of advanced research.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**LING 520 (PSY 520) Seminar in Psycholinguistics**

Consideration of theoretical and research issues relevant to psychological aspects of language sounds, syntax and semantics, and other cognitive support.

In this seminar, psycholinguistic approaches to bilingualism will be examined. Bilingualism is of interest for a number of reasons. First, despite the prevalence of monolinguals in the United States, most people of the world are bilingual. To have a genuinely universal account of human cognition will therefore require a detailed understanding of the relations between language and thought in individuals who speak and understand more than one language. It will be essential that research on basic cognitive functions in bilinguals examines both the course and the consequence of second language acquisition. Second, bilingualism provides a unique vantage point from which the relations between thought and language may be viewed. Historically, this issue was the focus of the debate over the Whorfian hypothesis (i.e., does language determine thought?). In contemporary psychology, it has emerged as a central issue in the debate over modularity. Understanding the form of language and memory representation in the bilingual may provide an important set of constraints in modeling the fundamental categories of the mind. Finally, bilingualism can provide a research tool for examining cognitive functions that are sometimes impenetrable within an individuals first language. The examination of the mapping of form to meaning in Constructing syntactically well-formed sentences in two languages with contrasting syntax, or in understanding the meaning of words that have similar form but differ in meaning in two languages, provides a tool for developing converging sources of evidence to test theories of language comprehension and memory. Topics to be covered include second language acquisition in children and adults, language comprehension and memory in second language, code switching and language mixing, the consequences of bilingualism, and the neuropsychology of bilingualism.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**LING 521 Proseminar in the Language Science of Bilingualism**

This course provides a cross-disciplinary overview of language science approaches to bilingualism and second language learning.

**Proseminar in the Language Science of Bilingualism (3)**

**Effective:** Spring 2010

---

The Pennsylvania State University
LING 522 Proseminar in Professional Issues in Language Science (3) This course addresses issues of professional development in the language sciences with special attention to cross-disciplinary research.

Bachelor of Arts: None
Effective: Spring 2010

LING 548 Sociolinguistics (3) Study of social and linguistic aspects of language change, varieties, policy, social inequality, language communities, language, society, and thought.

LING 548 Sociolinguistics (3)

This course investigates the sociolinguistic bases of linguistic diversification. Linguistic diversity, that is, the process by which a single linguistic system spreads and changes over time into regional and social varieties, is found in all societies. It is through the study of linguistic variation that linguists gain access to issues in language change, dialects, language policy, social inequality, language communities, and language, society, and thought. The course contrasts traditional studies of linguistic change, which concentrate on system-internal factors, with sociolinguistically based approaches, which investigate factors from outside the linguistic system. The key to the approach is that the study of linguistic variation and change in real time allows a unique view of the system as it has developed and as it is currently structured. This is because linguistic variation can be viewed and studied as change in progress, and quantitative and qualitative methods have been developed which allow changes to be isolated and identified, and to which social significance can be attributed. A basic assumption behind the content of this course is that linguistic variation is the starting point of most linguistic change and that useful insights into the past can be achieved by exploring present-day linguistic systems. Students will be evaluated by data analysis assignments (30%), review of research literature (30%) and databased research project (40%). LING 548 Sociolinguistics will be a core requirement of the proposed Ph.D. in Applied Linguistics. In addition, LING 548 will be a required course for the Departments of German and Spanish Ph.D. options in Applied Linguistics.

Lit/Dispt Res/Skills (SKILS)

SKILS 950L Advocacy I (4) Advocacy I teaches pretrial and trial skills through a combination of lecture, written and oral courtroom exercises, and videotape review.

Advocacy I (4)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2007
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 950R Advocacy I Advocacy I teaches pretrial and trial skills through a combination of lecture, written and oral courtroom exercises, and videotape review.

Advocacy I

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2007
Prerequisite:
SKILS 951 Advocacy II (3) Students synthesize the individual trial skills learned in Advocacy I by preparing and conducting an entire case, from the initial interview of the client through a trial on the merits. Each case is tried before a jury and judge from a Pennsylvania or federal court. All trials are videotaped in their entirety.

Advocacy II (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2013

SKILS 952 Strategic Legal Research (3) This course is designed to provide students with an advanced understanding of ways lawyers use primary and secondary legal research sources and finding tools to successfully represent their clients. An emphasis is placed on the development of effective legal research strategies that take into account choice of format (e.g., the relative advantages and disadvantages of print and electronic sources), cost/benefit analysis of format choice, evolving approaches by law firms and private practitioners to billable research hours, use of computerized tools to organize research results, and presentation of research results to case supervisors. Course content will be presented in a hybrid format consisting of two hours per week of in-class meetings with the remaining credit to be completed by coursework outside scheduled class time through online and written assignments.

Strategic Legal Research (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2012
Prerequisite: 

SKILS 954 Pretrial Advocacy (2) Students work with case files through written exercises and classroom simulations to gain a thorough understanding of the procedural rules and advocacy tools used in the pretrial stages of litigation. The course grade is based upon class participation and the written exercises.

Pretrial Advocacy (2)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2013

SKILS 955 Evidence (3) This course presents evidence in trials under the Federal Rules of Evidence, at common law and in equity and with reference to administrative bodies. The reasoning from which rules arise in areas including relevancy, competency, privilege, examination of witnesses, writing, the hearsay rule and its exceptions, burden of proof, presumptions, judicial notice, and constitutional evidence problems is also addressed.

Evidence (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2006

SKILS 957 Client Counseling (2) This course introduces students to the dynamics of a productive attorney-client relationship, the goals of interviewing and counseling, and structures and techniques that can be used to achieve those goals. The focus is on developing students' skills in interviewing and counseling. Instruction consists of assigned reading, problem-solving exercises, group discussion, and practice through simulations. Client Counseling is one of the core courses for the Certificate in Dispute Resolution and Advocacy. Preference is given to students seeking the Certificate in Dispute Resolution and Advocacy.

Client Counseling (2)

General Education: None
Diversity: None
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 958 Conflict of Laws (3) How do we resolve problems when the substantive law or procedural rules of states or nations conflict? For example, if Hawaii enacts a statute permitting same-sex marriages, must other states recognize such a marriage? If an American-owned factory explodes in India, may the injured pursue claims under American tort law? The course will provide a review of jurisdictional concepts introduced earlier in first-year courses, introduce choice of law issues for multistate or multinational transactions or events, and examine the influence of the United States Constitution on the reach of a state’s judicial decisions or legislation outside the state.

Conflict of Laws (3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 1998

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 959 Mediation (3) This course examines the legal and ethical issues involved in mediation and develops students' skills as mediators and as attorneys representing clients in the process.

Mediation (3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2004
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 960 Negotiation/Mediation (3) This course combines the law and ethics of negotiation, mediation and settlement with economic and psychological bargaining theory and regulat hands-on practice in representing clients in negotiation and mediation. Bargaining theory (including distributive and integrative bargaining), relevant socio-psychological research, negotiation and mediation ethics, the law of settlement, and the basics of contract drafting are all introduced. Instruction consists of assigned reading, a series of simulations and exercises (including drafting a resulting contract), written negotiation planning and self-evaluation, feedback, and group discussion.

Negotiation/Mediation (3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2011

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 962 The U.S. Law of Arbitration (3) This course provides an introduction to the domestic law and practice of arbitration. It assess the statutory and decisional law basis for arbitration, especially the provisions of the Federal Arbitration Act. It investigates the central doctrinal issues in the field: the enforceability of unilaterally-imposed arbitration agreements, the arbitrability of statutory rights - in particular, civil rights matters, and the use of contract to establish the law of arbitration between the arbitrating parties. Emphasis is placed upon practical problems that have emerged in the practice of arbitration law: the selection of arbitrators, the use of discovery and evidence-gathering in arbitral proceedings, and the content of arbitration agreements. The course also addresses the new uses of arbitration in the consumer, health, and employment fields.

The U.S. Law of Arbitration (3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2010

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILS 964 Intensive Legal Writing and Drafting (2) This course develops students' skills in common legal writing formats other than memos and briefs. Not intended as a remedial course, this course rather provides an opportunity for students to sharpen legal writing skills with an emphasis on clarity and precision of expression. Weekly writing assignments include

The Pennsylvania State University
a few fully drafted documents (e.g., short will, a short contract, a statue), as well as letters, short pleadings, jury instructions, and other short pieces. Students will concentrate on re-writing and editing their work.

**Intensive Legal Writing and Drafting (2)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Summer 2011  
Prerequisite:  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.  

SKILLS 965 Federal Courts (3) This course addresses the relationship of federal courts to administrative agencies and state courts.

**Federal Courts (3)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Fall 2005  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILLS 966 Arbitration Workshop (3) The first part is the drafting of arbitral clauses in a variety of circumstantial settings (maritime, labor, commercial, consumer, and employment) in regard to CPR best practices standards and addressing the authority of the arbitrators and the configuration of the arbitral procedure. This process would take several sessions. The second branch would be to view and then construct an arbitral trial along with the protocol for its management, both with the arbitrators and the parties. This would take some time as well. Third, the students would be asked to participate in a statutory drafting workshop that reflects their experiences in the two previous branches. They would be asked to evaluate the UNCITRAL Model Law and several national laws of arbitration and arrive at a new and better model law.

**Arbitration Workshop (3)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Summer 2011  
Prerequisite:  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.  

SKILLS 967 Federal Court Practice (2) This course introduces contemporary issues in several topical areas of particular interest to litigating in federal courts. The course topics are varied, with the unifying theme being that each topic possesses either particular prominence or exclusive jurisdiction within the country's federal court system. These topics include: the history and organization of the federal courts, the courts’ relationship with Congress, the practical dynamics of federal procedure, strategic considerations involved in a litigant's choice of federal court, employment discrimination, federal criminal matters, sentencing, civil rights cases, and habeas.

**Federal Court Practice (2)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Fall 2011  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

SKILLS 968 Judicial Opinion Writing (2) Students will learn about the role of a judicial clerk and how to draft judicial opinions. Students will recognize the impact of written advocacy on judicial opinion writing as they switch roles from advocating as a lawyer to deciding issues raised by the advocates and writing opinions that implement subtle persuasive writing techniques. Students will develop a deeper understanding of the process for creation of legal precedent through opinions, including the impact of standards of review and procedural posture. The course will cover the common forms of judicial writing. With individualized feedback, students will develop precision in self-editing and revision skills and will practice producing concise, clear, and accessible written work.

**Judicial Opinion Writing (2)**

General Education: None

The Pennsylvania State University
Prerequisite:

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILLS 969** Legal Journalism (2) Students will learn journalistic writing styles to prepare them to contribute accurate and accessible legal information and analysis to general interest and legal trade media as legal analysts or professional journalists. For legal trade publication work, the emphasis will be on readability and appropriate depth for a professional audience. Students will learn journalistic standards of truth and interviewing techniques for print and broadcast media. Live broadcast techniques, including live interview hosting, will also be covered.

**Legal Journalism (2)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2013

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILLS 971** Scholarly Writing Workshop (1) This course provides students with the framework for developing a thesis, conducting research, and producing a significant scholarly paper. In an interactive workshop setting, students will discuss progress and receive feedback from faculty and fellow students on: (1) identification and refinement of a thesis; (2) developing and implementing a research plan; (3) appropriate use of authority, including legal citation form; and (4) developing and refining a critical perspective and scholarly argument. Students must be concurrently enrolled in a seminar (SEM) course or an independent study (PERSP 996) of at least two credit hours.

**Scholarly Writing Workshop (1)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2014

Concurrent: SEM course at least 2 credits or PERSP 996 for at least 2 credits

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILLS 972** Mediation of Environmental and Public Conflicts (3) This course focuses on mediation and dispute resolution of complex public issues, particularly in the environmental and natural resource arena.

**Mediation of Environmental and Public Conflicts (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2014

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILLS 982** Pennsylvania Practice (2) This class will acquaint the student with civil procedure at the state trial court level. Using Pennsylvania as the model, the course traces a civil case from service of process to trial and includes discussion of venue, pleadings, discovery and dispositive motions. The course also deals with other important aspects of civil practice including statutes of limitation, comparative negligence, compulsory arbitration and settlement.

**Pennsylvania Practice (2)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2011

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILLS 983** Writing and Editing for Lawyers (2) The goal of the course is to improve the legal reading, writing, and editing skills of students. The course will reinforce rules of grammar, punctuation, sentence structure, usage, voice, tone, style, and organization. The emphasis will be on the application of these rules in the context of legal writing. Students will learn how to craft sentences that are accurate, brief, clear, precise, and sometimes persuasive.

**Writing and Editing for Lawyers (2)**

General Education: None
Diversity: None
Bachelor of Arts: None
**SKILS 986 Remedies (3)** Remedial devices focusing on the theory and application of legal and equitable relief are analyzed comparatively. The course covers the procedural and substantive law elements of damages, specific performance, injunctions, declaratory judgments, reformation, rescission, and restitution.

**SKILS 987 Writing Workshop (2)** The goal of this course is to improve the legal writing and editing skills of students. By engaging in the process of directed writing and editing, students will learn to write clearly, succinctly, precisely, and sometimes persuasively. Emphasis will be given to organization and integration of procedural and substantive aspects of cases.

**SKILS 988 Legal Problems of Indigents (2)** This course is an introduction to law relevant to assisting people in poverty including law addressing public benefits, housing, consumer issues, custody, domestic violence, and private rights of action. It will also address realities of existence for people in poverty and consider historical and policy perspectives. Finally, the course will focus on some practical skills, and students will participate in mock hearings and/or mock interviews.

**SKILS 997 Special Topics (1-9)** Formal courses given infrequently to explore, in depth, a comparatively narrow subject that may be topical or of special interest.

**SKILS 997A Scientific Evidence (3)** This course examines the legal principles governing the use of scientific evidence in criminal and civil litigation. Aspects of the Fourth, Fifth, and Sixth Amendments as they apply to scientific evidence in criminal cases will be considered. The course also introduces the basic scientific and statistical underpinnings of expert testimony from the physical, biological, medical, behavioral, and social sciences. A series of litigation-related writing exercises and occasional problem sets will be assigned. Depending on class size, oral presentations or trial or appellate practice simulations also may be part of the course.
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILS 997A Scientific Evidence (3)** This course examines the legal principles governing the use of scientific evidence in criminal and civil litigation. Aspects of the Fourth, Fifth, and Sixth Amendments as they apply to scientific evidence in criminal cases will be considered. The course also introduces the basic scientific and statistical underpinnings of expert testimony from the physical, biological, medical, behavioral, and social sciences. A series of litigation-related writing exercises and occasional problem sets will be assigned. Depending on class size, oral presentations or trial or appellate practice simulations also may be part of the course.

**Scientific Evidence (3)**

Bachelor of Arts: None  
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILS 997B Civil Pre-Trial Practice and Advocacy (3)** Disposition before trial occurs in the vast majority of civil lawsuits (e.g., 98% of federal cases) which makes pre-trial advocacy the dominant part of legal practice at most law firms and agencies. Prior to entering the courtroom, most junior attorneys will cut their legal teeth on pre-trial activities and motions practice. This course will combine elements of core curriculum courses, legal writing, and experiential learning by engaging students with a robust fact pattern requiring research and analysis leading to written pre-trial advocacy including pleadings, discovery and disclosures, motions (procedural, substantive and dispositive), negotiation and settlement documents. Paralleling a case through complex civil litigation, this "in-context" course will provide students with insight into the process of preparing a case for trial or, more likely, bettering the client’s position for a pre-trial disposition.

**Civil Pre-Trial Practice and Advocacy (3)**

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**SKILS 997C Spanish and Bilingual Communication in Law Practice (2)** Designed for students who want to improve their ability to understand and communicate with Spanish-speaking clients and colleagues in legal settings. Includes practical reading, speaking, and writing exercises using real documents from Spanish-speaking courts, attorneys, and statutes. Encompasses an introduction to research resources, citation norms, and other tools related to practicing law in Spanish, and includes discussions of regional variations in law, ethics, and language in the Spanish legal world. Guest speakers or other contact with native Spanish-speakers in the profession will also be scheduled.

**Management (MANGT)**

**MANGT 510 Project Management (3)**

A problem-based, interdisciplinary course in project management skills and techniques needed to manage projects in a modern business environment.

**MANGT 510 Project Management (3)**

Project Management has been labeled by *Fortune* magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, to respond to rapid time-to-market demands. This course would give business majors a competitive advantage in the job market, as companies are in great need of a trained cadre of qualified project managers who can allow the business firm to operate to its highest potential.

The role of the instructor in this course is to train students in the wide variety of demands and skills for which they must be qualified: the ability to exert leadership in managing project teams, an understanding of people and behavioral skills, and the ability to effectively use computer-based scheduling and tracking software to keep to timetables and schedules.

The course itself would be set up around semester-long projects, either developed by the instructor, or developed (in collaboration with the instructor) by students involved in business enterprises. As a result, students would have real-time experience in the challenges of creating a unified team, solving problems, tracking their projects, and presenting a final paper and presentation on the process.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2000
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
MANGT 515 Cost and Value Management (3) A problem-based course that emphasizes project cost control and teaches students to apply techniques to control projects in business.

Project management has been labeled by Fortune magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. At the same time, however, substantial interest has been generated in the methods for effective cost control in the project environment. How can an organization implement projects while maintaining control of its costs and value?

The role of the instructor in this course is to promote student learning of a wide variety of knowledge and skills required for successful project management. These include the ability to understand "cost" and "value" as these terms apply to project management, to understand the nature of budgeting and financial analysis for project selection and control, and the ability to interpret control information as it allows for change (configuration) management of mid-stream projects.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2002
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MANGT 520 Planning and Resource Management (3) A problem-based course that addresses techniques for planning the project development process, including securing resources and resource management.

Project management has been labeled by Fortune magazine the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. The key "front-end" processes associated with successful project management consist of planning and resource management—in effect, the need to first plan the work, ensure necessary resources are available, and thoroughly understand the components of the project plan, including activities and their interrelationships.

The role of the instructor in this course is to promote student learning of a wide variety of knowledge and skills required for successful project management. These include the ability to understand planning and resources as these terms apply to project management, to understand the nature of developing comprehensive plans and schedules, manage resources for their maximum effect, and learn how to respond to crises or unanticipated events in terms of adjustments to plans and resource requirements.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2002

MANGT 525 Commercial Law and Project Procurement (3) A problem-based course that addresses elements of commercial law and procurement practices and their implications for project management.

Project management has been labeled by Fortune magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. This course looks at the key issues in contracts, contract law, negotiation, and procurement. In developing projects for external clients, it is vital that organizations and project team members understand some of the basics by which contracts are negotiated and enforced. The role of the instructor in this course is to promote student learning of a wide variety of knowledge and skills required for successful project management. These include the nature of contracts and contract law, the use of contracts as a procurement strategy, how to understand the nature of contracts, their use as a negotiation tool, and the use of

The Pennsylvania State University
bidding and negotiation in relationships between project organizations and their customer base.

MANGT 531 Organizations (3) An examination of organizational theories and processes of organizational behavior.

MANGT 535 Interpersonal and Group Behavior (3) A human relations-based course that identifies the significant challenges that managing individuals on project teams represents.

MANGT 535 Interpersonal and Group Behavior (3)
Project management has been labeled by Fortune magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. This course serves as an important linkage between the technical demands of project management and the behavioral challenges that await project teams in the form of interpersonal behavior and group interactions. The role of the instructor in this course is to promote student learning of a wide variety of behavioral knowledge and skills required for successful project success as well as recognizing the impact of issues such as motivation and negotiation skills for managing projects.

MANGT 540 Strategy: Corporate, Business and Project (3) A problem-based course that focuses on linking projects to overall corporate strategy.

MANGT 545 Project Team Leadership (3) This course focuses on development of team leadership skills and the ability to solve team problems related to human interaction.
The first half of this course consists of self-paced assigned readings which over basic concepts of team leadership. Students will complete quizzes over each chapter which they read and begin writing a personal case analysis. The second half of the course utilizes case studies of project teams and includes extensive class and small group discussions. In addition, each student will present a case analysis to the class. Students will have the opportunity to develop basic team leadership skills and the ability to solve team problems as they arise.

MANGT 575 Management of Projects (3) A problem-based capstone course that integrates the themes necessary to appreciate the overall challenge of project management.

MANGT 575 Management of Projects (3)
Project management has been labeled by Fortune magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. This course serves as a capstone experience intended to require students to be able to integrate the various elements from the previous set of project management courses they have covered. The course requires all other courses as prerequisites or co-requisites so that students may be sufficiently knowledgeable to synthesize all prior material. The role of the instructor in this course is to promote student learning of a wide variety of knowledge and skills required for successful project management. These include understanding the complex, widely diverse nature of the skills and knowledge required of modern project managers. In order to cover sufficiently the capstone material, students must have a thorough background in the various issues that comprise this capstone experience.

MGMT 410 Project Management (3) A problem-based, interdisciplinary course in project management skills and techniques needed to manage projects in a modern business environment.

Project Management (3)

Project Management has been labeled by Fortune magazine as the number one career choice for the coming decade. Increasingly, organizations are adopting project management techniques and structures within their business framework. Project management offers the twin advantages of allowing organizations to create products and processes efficiently, through optimal use of resources, and rapidly, in order to respond to rapid time-to-market demands. This course would greatly aid business majors, as companies are in great need of a trained cadre of qualified project managers who can allow the business firm to operate to its highest potential.

The role of the instructor in this course is to train students in the wide variety of demands and skills for which they must be qualified: the ability to exert leadership in managing project teams, an understanding of people and behavioral skills, and the ability to effectively use computer-based scheduling and tracking software to keep timetables and schedules.

The course itself would be set up around semester-long projects, either developed by the instructor, or developed (in collaboration with the instructor) by students involved in business enterprises. As a result, students would have real-time experience in the challenges of creating a unified team, solving problems, tracking their projects, and presenting a final paper and presentation on the process.

check the specific course syllabus.

MGMT 415 Project Portfolio Management and Organizations (3) An advanced course in project management focusing on portfolio planning and control within the context of specific organizational challenges.

MGMT 415 Project Portfolio Management and Organizations (3)

Project Portfolio Management (PPM) is a strategically-focused course on the management of projects, programs, and portfolios in organizations. The management of individual projects is a complex, multi-level challenge involving myriad issues of planning, organizing, and controlling all project elements. Project portfolio management addresses a more strategic need; namely, the process of project selection in order to develop a balanced portfolio of projects designed to support organizational initiatives. As a result, this course addresses the critical issues of maximizing value in a portfolio, linking projects to organizational strategy, understanding the critical organization effects of structure, environment, and culture on project success, and creating a coherent PPM framework for the firm.

Because the focus is more strategic, the role of the instructor in this course is to go beyond the mechanics of planning and controlling a single project to training students how to think strategically where projects and programs are concerned; to recognize their role in creating a PPM plan for an organization, selecting projects for value, rebalancing a project portfolio, and maintaining this focus within the organization.

MGMT 418 Project Planning and Resource Management (3) Advanced course in project management focusing on a more in-depth approach to project planning and scheduling and resource management.

MGMT 418 Project Planning and Resource Management (3)

Project Planning and Resource Management is a more in-depth look at some of the most important aspects of project management; the ability to accurately plan and schedule projects using the latest and most accurate methods. Further, the course addresses resource management within the context of planning, noting the important linkage between these two elements. Accurate planning can be done through a variety of techniques, including CPM, PERT, simulation, linear programming and other optimization methods. Students will learn when each of these methods are most useful, benefits and drawbacks of various planning and resource management techniques, and how to apply these techniques to their projects. In addition, students will learn about different types of project risks, and techniques for analyzing and managing these risks.

Because the focus is hand-on and problem-based. The role of the instructor in this course is to demonstrate these analytical techniques through classroom exercises and assignments and software packages, including MS Project, simulation, and Analytic Hierarchical Process (AHP).

MGMT 425 (IST 425, ENGR 425) New Venture Creation (3) Via problem-based learning, teams define new business ventures to meet current market needs, develop business plans, and present to investors.

MGMT (IST/ENGR) 425 Introduction to Entrepreneurship (3)
The goal of MGMT (IST/ENGR/ENTR) 425 is to better prepare undergraduate students to be business leaders in adaptive, globally-minded, technology-savvy companies. The course is structured so students develop skills that are of high value in any workplace: they develop improved leadership skills, higher self-efficacy, creativity and the ability to deal with ambiguity. On course completion, students will have a working knowledge of traditional and non-traditional ways for identifying a new product or business opportunity, quantifying the potential, understanding the key competitive factors, researching the audience and producing a convincing executive summary for internal or external financing and launch. Students who want to augment the skills and knowledge from their major with the ability to refine a new product/service process in an interdisciplinary team will find MGMT (IST/ENGR/ENTR) 425 a valuable course.

This is a novel problem-based learning (PBL) course, where the learning is student-centered, with faculty acting primarily in the role of facilitators. Active learning happens in this course because students develop ownership in their new business venture concept and are fully responsible for the genesis of the idea. The course leverages the on-line course management system (ANGEL) to define weekly learning objectives, support electronic delivery of assignments, robust video content with entrepreneurs is provided on CD-ROM or via ANGEL, providing additional insights into entrepreneurship. The technology or business segment focus of the class is easily adapted by using different case studies and course mentors.

This will be one of two courses in the new two-course sequence for business students in entrepreneurship. This course will be accepted as a supporting course in the Engineering Entrepreneurship Minor (E-SHIP) and in the Engineering Leadership Development Minor (ELDM). MGMT (IST/ENGR/ENTR) 425 can be used as a technical elective in many of the engineering departments. It will be accepted as a Support of Option course for the Information Sciences and Technology (IST) major.

This course will be offered each Fall and Spring semester with two sections each semester. Class enrollment per section will be set at 60 total.

MGMT 426 (ENGR 426, IST 426) Invention Commercialization (3) Working with Penn State inventions selected by the Intellectual Property Office, student teams define an optimum commercialization path each technology.

MGMT (IST/ENGR) 426 Invention Commercialization (3)
The goal of MGMT (IST/ENGR/ENTR) 426 is to have students understand why invention commercialization is complicated and difficult by participating in the process. For example, the inventor rarely has insights into the markets for his/her invention, is often not interested in the details of commercialization, and can be secretive. In addition, the business and financial communities often do not take the time, or have the resources, to understand new technologies and perform complex due diligence. Thus lack of due diligence often leads to rejection of innovation because existing companies often discount new technologies from outside the company as NIH - "not invented here".

Effective transfer of new invention or innovation to a commercial product requires at least three different functional communities to interface: technical, legal and business. Each uses a different language, comes from different educational and cultural backgrounds, and may have an inherent distrust of the others. These functional barriers are difficult to overcome.

This course teaches how these barriers can be broken down as student teams help bridge the perceived chasm between key players in the invention commercialization process. In these teams, students bring the skills and knowledge from their major to develop an invention commercialization recommendation for the Technology Transfer Office and the inventor. For example, business students focus on finance and market opportunity assessment; engineering and IST students focus on design refinements, prototyping support, and (if appropriate) making technology suggestions to the inventor.

Upon completing the course, the students will have a working knowledge of different university and corporate technology or invention commercialization processes, important intellectual property management tools for inventions (patents, license agreements, option agreements) source of funding to move inventions toward product development, and delivering top quality presentations which outline the recommended commercialization path. Students who enjoy open-ended projects which involve the interplay of business and invention of who wants to work on interdisciplinary teams with the newest inventions will find this course a valuable course. NOTE: Because the inventions/products are
based on Penn State faculty intellectual property, students must sign the Penn State Special Intellectual Property Agreement For Students - For Use When Assigning Intellectual Property to The Pennsylvania State University. The form can be viewed at http://guru.psu.edu/policies/RAG13.html

The course will be offered both Spring and Fall semesters with an enrollment of 40 students.

**MGMT 427 Managing an Entrepreneurial Start-Up Company (3)**

Managing an Entrepreneurial Start-Up Company (3) Exploration of the tensions and experiences of starting and growing a new company.

Start-up companies have a high failure rate. Acquiring and balancing limited resources, changing direction quickly, building a coherent team, managing intellectual property, and creating new markets all test a wide range of managerial skills not usually demanded in one person within a larger organization. Whereas a large company has a strong and well-defined structure and ample resources to deal with unexpected challenges, a start-up usually has insufficient resources, or management experience and yet must deal with daily important and often unpredictable forces. It is the tenacity of an entrepreneur that can take a company through the valleys of despair to eventually succeed.

Students will be exposed to these tensions and experience through problem-based learning methods what it is like to start and grow a new company. The course will provide students with knowledge and experience to increase the likelihood of success whether as a principal in a small company or an investor representative.

**MGMT 431 Entrepreneurship and Small Business Management (3)**

Entrepreneurship, new ventures, and management of small firms.

**MGMT 432 Small Business Field Study (3)**

Supervised field study with a small firm.

**MGMT 433 Leadership and Team Building (3)**

Team-based learning approach to developing conceptual knowledge, skills sets, and personal competencies needed for leading and managing organizations.

To lead effectively and to manage others in contemporary work contexts requires mastery not only of conceptual knowledge, but also of the intra- and inter-personal competencies and skills sets that are vital to successful performance in a work environment. This course emphasizes an experiential-based learning approach that is designed to impart skill sets and competencies in areas such as leadership, teambuilding, negotiating, communicating, valuing diversity, managing conflict, and more. The course thus uses assessment exercises, role playing techniques, group problem solving exercises, and other experiential-based learning techniques in order to provide students with a framework for better understanding
their own strengths and weaknesses, to enable them to practice, enhance, and to gain confidence in their competencies in these various areas, as well as to enable students to better appreciate when and how to effectively apply these skills sets and competencies in the workplace.

**MGMT 441 Organizational Staffing and Development (3)** This course focuses on the skills and methods managers need to manage staffing and development activities in organizations.

**MGMT 441 HRM Professional Seminar (Part 1): Staffing and Development (3)**

The purpose of this course is to give students the skills and knowledge they need to contribute to organizational staffing and development activities. Students will learn technical and organizational aspects of making hiring decisions, designing and implementing training programs, and developing career management initiatives. Topics include strategic human resource management, HR planning, the contingency workforce, HR information systems and technologies, job design, recruitment, selection, employment legislation, diversity, training, management development, career planning, and the like. This course is normally taken in the first semester of the senior year. It builds on information introduced in MGMT 341 (Human Resources Management) and moves beyond survey-level material to more specialized knowledge and skill. The course is taken concurrently with MGMT 442 (HRM Part One) and is typically taken as a precursor to MGMT 443 (HRM Proseminar, Part Two) and 444 (HRM Practicum, Part Two). These courses together constitute the core of the HRM Option for Management majors.

**MGMT 443 Performance Management (3)** This course focuses on skills and methods managers need to enhance the contribution of employees to organizational performance and effectiveness.

**MGMT 443 HRM Professional Seminar Part Two: Performance Management (3)**

The purpose of this course is to give students the skills and knowledge they need to enhance the contribution of employees to the performance and effectiveness of the organization. Students will learn technical and organizational aspects of performance planning, goal setting, performance and feedback, compensation and reward systems, incentive systems, high performance work organizational change, and the like. This course is normally taken in the second semester of the senior year. It builds on information introduced in MGMT 341 (Human Resources Management) and moves beyond survey-level material to more specialized knowledge and skill. The course is taken concurrently with MGMT 444 (HRM Practicum, Part Two) and is typically taken after students have completed MGMT 441 (HRM Proseminar, Part One) and MGMT 442 (HRM Practicum, Part One). These courses together constitute the core of the HRM Option for Management majors.

**MGMT 445 (US) Managing a Diverse Workforce (3)** This course focuses on developing knowledge and skills for managing demographic, functional, occupational and identity-based differences within and among organizations.
MGMT 445 Managing a Diverse Workforce (3)

This course focuses on developing knowledge and skills for managing differences within and among organizations. It provides an in-depth look at the sources of diversity-related conflicts in organizations, constructive approaches for managing these conflicts, and how corporations can leverage diversity for competitive advantage. The overall objective is to provide students with an understanding of the business case for diversity, the legal requirements surrounding the management of diversity in organizations, the structural dimensions of implementing diversity programs, skills for managing diversity in teams, as well as a general sensitivity to the kinds of issues that create conflicts within and between firms. Students will explore legal requirements including: EEOC, affirmative action, and the Americans with Disabilities Act and the implications of these for selection, compensation, promotion and dismissal. Examples of specific steps corporations have taken to address demographic, functional, occupational, and identity-based differences will be provided. Through the use of interactive case studies and experiential exercises, students will be given opportunities to learn about and appreciate their own and others' cultural heritages, reflect on constructive approaches for handling diversity-related conflicts (including those stemming from functional, occupational and identity-based differences as well as demographic ones) and for designing human resource management systems that capitalize on diversity and promotes inclusion.

**MGMT 466 Organizational Learning and Knowledge Management (3)**

Examination of the social processes through which organizations continuously develop, acquire, interpret, and apply information and knowledge for performance enhancement and continuous improvement.

**MGMT 466 Organizational Learning and Knowledge Management (3)**

The primary focus of this course is to examine critically the social structures and processes through which organizations continuously acquire, develop, organize interpret, distribute and apply information and knowledge for performance improvement.

The Pennsylvania State University
enhancement and continuous improvement. Topics such as single-loop learning, double loop learning, and deuterolearning (i.e., learning how to learn) are considered, particularly as they apply to self managed work teams, process-based and network structural design, employee involvement approaches, impact of organizational culture and leadership practices. A second focus of the course is to examine the social processes and structures through which the key outcome of the learning process -- organizational knowledge -- usually expressed in terms of improved core competencies, and intellectual capital, can be leveraged across products, functions, business units, geographical regions, and competitive environments to improve organizational performance and competitive advantage and provide added value for customers. Particular emphasis is placed on knowledge management in support of the organization's competitive strategy, with a focus on the exchange of tacit, person-to-person knowledge that is difficult to codify and store. Additional emphasis is placed on the mechanisms available for organizational members to gain access to needed knowledge.

MGMT 471 Strategic Management (3) Issues that influence the competitive performance of the firm are identified and examined.

MGMT 471 Strategic Management (3)
This course focuses on the management of the firm using a strategic perspective. The strategic perspective emphasizes the firm as the unit of analysis (e.g., analyzing how a firm competes in its industry), and it addresses key decisions that have a long-term impact on the structure and performance of the organization (e.g., diversifying into a new business or changing the company's strategy). The course draws heavily on prior business courses in accounting, marketing, finance, and international management. Key topics include industry analysis, competitor analysis, company analysis, corporate-level strategy, business-level strategy, strategy implementation, and firm performance. The course is normally taught using the case methods, but the course may include a computer simulation and/or oral group presentations.

MGMT 483 Compliance and Fairness in Organizations (3) Compliance with employment laws with respect to managing human resources and fair treatment in employer-employee relationships.

This course is intended for undergraduate students who want to learn more about the laws governing the employment practices introduced in the survey course in human resource management. This course will clarify the legal context within which businesses in general, and managers in particular, manage their employees. Students will learn about the legal rights and responsibilities of both employers and employees. Objectives of the course include learning how to comply with workplace laws and regulations, learning how to legally and effectively implement these requirements in an organization, and, as managers of human resources, knowing how to run a safe and fair workplace. To accomplish these objectives, students will evaluate and analyze federal employment laws and regulations, state employment laws (where applicable), and U.S. Supreme Court rulings. The emphasis will be on providing an informed legal context for managerial behavior. Student achievement of these learning objectives will be evaluated using several methods: students will summarize, interpret, and analyze employment law cases, write and develop a portfolio of critical essays of corporate employment practices, research and present (with team members) a project analyzing a current legal challenge to a specific company employment practice, and prepare a comprehensive written examination of material covered in the course.

**MGMT 534 Leadership and Change in Organizations (2)**

Understanding yourself as a leader, particularly as a leader in organizations and especially a leader of organizations undergoing change.

**Leadership and Change in Organizations (2)**

This course mixes concept with practical, workable knowledge. We will focus on how you think about leadership, how things get done, and how things might be improved in organizations. This is the course that will allow you to discover, consider, and alter your leadership tendencies and values. Self-management is the major emphasis. Another is learning to lead organizations and the people in them humanely. It is also a course that will allow you to see the differing viewpoints and perspectives of your peers concerning many leadership and organizational issues.

**MGMT 539 Seminar in Organizational Social Networks (3)**

Learn theory, concepts and methods for research on organizational social networks.

**Seminar in Organizational Social Networks (3)**

This course familiarizes doctoral students with the theory, research and methodological issues connected with social network analysis in organizational contexts. The course encompasses topics from the micro level (e.g., cognition and networks) to the macro level (e.g., interorganizational networks) and introduces a range of network ideas concerned with centrality, structural holes, embeddedness, and social capital. Class periods will consist mainly of focused discussion of academic papers, but will also include discussion of data analysis exercises, and student presentations. Upon completion of the course, students should have a good grasp of social network concepts and methods and be able to use them to conduct research. The course requirements include participation in discussion, the completion of data analysis exercises,
and the writing of a research paper. The course is designed for 15 students and is likely to be offered once every two years.

**MGMT 561 Global Strategy and Organization (1-3)** Course focuses on three major aspects of international business: competitive strategy, organization design, and management processes.

**MGMT 561 Global Strategy and Organization (2)**
The course focuses on three major aspects of international business: competitive strategy, organization design, and management processes. As multinational companies globalize, they rely on a variety of managerial and organizational arrangements to accomplish their strategic objectives. We will examine those arrangements according to several major corporate decisions: the decision to go abroad, doing business in a particular country or region, transforming a multinational firm into a global firm and so on.

**MGMT 565 Power and Influence (2)** Provides a pragmatic and ethical framework for analyzing the sources of power in organizations and its effective use.

**MGMT 565 Power and Influence (2)**

Power and politics are ever-present and necessary features of organizational life. Without them, much of what gets done in organizations could never be accomplished. However, power can also be abused, and personal or political goals can
overshadow organizational ones. This course provides a framework for intelligently analyzing the sources of power in organizations, and the circumstances that lead to its attainment and effective use. It also offers a framework for evaluating political behaviors on both pragmatic and ethical grounds.

**MGMT 597A Motivation Theories for Management Research (3)** Motivation theories are unparalleled in scope, encompassing virtually all behavior (as well as many attitudes and emotions) of interest to management researchers and practitioners. Leaders must motivate followers, team members must motivate peers, and individuals even need to motivate themselves to strive for and ultimately achieve outcomes. The role of this course is to familiarize students with relevant management and psychological theories of motivation, focused primarily on motivation at the individual level (i.e., answering the question of why individuals behave the way they do, but not questions on why teams/organizations behave the way they do). Each week we will cover a single theory (e.g., regulatory focus theory; social exchange theory; self-determination theory) and recent empirical articles that have applied the theory to gain insight into various management research topics.

Management-Cl (MNGMT)

MNGMT 505 Managing Human Resources (3) Issues in human resource management including recruitment and selection, employee development, performance management, employee and labor relations, and employee safety.

MNGMT 505 Managing Human Resources (3)
This course examines the primary functions and responsibilities of those who manage human resources in formal organizations. The emphasis of this course is on the practical application of the methods human resource specialists, generalists, and managers use to perform their duties. The course is designed to appeal not only to future (or current) human resource practitioners, but also to anyone who aspires to manage people in organizations. Topics covered include management practices, the legal and regulatory environment of human resources, employee recruiting, selection and placement, training and development, performance management, compensation and benefits, employee and labor relations, and employee health, safety, and security.

This course surveys the major functions and responsibilities of human resource managers. In doing so, a primary objective is to gain greater factual knowledge of human resource issues by studying organizational practices, analyzing cases, conducting research using the World Wide Web, and utilizing other sources of information. It is also hoped that each student will develop a philosophy concerning the relationships among the employee, employer, union, and government agencies involved in employment issues.

Students' knowledge is evaluated, in part, using written examinations. Each student is also typically the member of a small team that will research a specific challenge, trend, or issue that currently confronts human resource managers. Each team prepares a concise and focused presentation and written summary on its chosen topic. Other means of evaluating student knowledge may include case analyses, investigations of human resource practices within specific organizations, or other related projects.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2001
Prerequisite:

MNGMT 511 Organizational Behavior (2) Individual and group behavior in organizations; motivation, performance and rewards, job satisfaction, decision processes, conflict resolution; job and organizational design.

MNGMT 511 Organizational Behavior (2)
This course provides students with an enhanced understanding of their own behavior, the behavior of others, and the capability to deal more effectively with people and groups in organizations. Primary emphasis is placed upon application of experiential learning theory in developing the ability to perform well as a member of a team, and also in facilitating team effectiveness. As adult learners, students are empowered to become active creators of their own learning, and working with the faculty member responsible for the course, to develop skill sets and competencies in analyzing ethical issues, negotiation and communication skills, and developing leadership responses to these issues.

This course provides the skill sets and competencies underpinning the collaborative learning model used throughout the MBA program. It is intended to be taken by students who have not taken a similar course either as part of their undergraduate programs, or as graduate work. Where required, this course must be among the first 6 credits taken in the MBA program.

Evaluation will be based upon class participation (10%), two examinations (70%), and a group presentation of a management case (20%). Each examination will cover about half of the course material. Both exams will consist of essay questions, and will be evaluated on the basis of demonstrated knowledge of course content as well as clarity and accuracy of presentation. Students will choose a team based on the topic they wish to study. Each team will be responsible for critically addressing and analyzing a particular management case, and making a formal in-class presentation. The case reports will be evaluated on the basis of each teams ability to: 1) address and integrate relevant material from each text
chapter; 2) demonstrate critical thinking and evaluation of the case; and 3) provide a formal, professional presentation of the case material.

**MNGMT 514 Organizational Learning (2)**

The objective of this course is to provide an overview of current theory and practice in the field of organizational learning—a developing field of applied social science. Organizational learning aims to improve the attributes of, and alignment between elements of the organization, and between the organization and its environments to improve effectiveness, performance, and satisfaction of primary stakeholders. The course focuses on the theories, research findings, techniques, and approaches to learning. Particular attention is paid to discussion practitioner-centered cases, and large-scale, system-wide organizational transformation. An understanding is developed of the paradigm shift necessary to achieve organizational transformation, and the re-conceptualization of management philosophies, principles, practices, and behavior that lead to high performance.

**MNGMT 520 Organizational Transformation (3)**

The objective of this course is to review the current theory and practice of organizational development (OD), and applied field of social science. ODs primary aim is helping to improve the "alignment" between individuals and the organization, and between the organization and its environment in order to achieve greater effectiveness, performance, and stakeholder satisfaction. The course provides an overview of theories, research findings, approaches, and concepts of OD. Particular attention is paid to discussing practitioner-centered cases in OD. Large-scale, system-wide organizational development - usually one that involves a paradigm shift is often referred to as Organizational Transformation or Re-engineering. The paradigm shift often involves a re-conceptualization of management philosophies, principles, practices, and behavior leading to a high performing, empowering organization.

Design, development, management of manufacturing systems in a supply chain context; tools, techniques, and applications at tactical and strategic levels.

**MNGMT 522 Operations and Supply Chain Management (3)**
The purpose of Operations and Supply Chain Management is to provide students with tools and knowledge that can help them increase productivity and profitability in a manufacturing environment. Both strategic and tactical aspects of operations management will be emphasized. The course is taught in supply chain context meaning that decisions made in manufacturing must consider the overall impact of the suppliers and customers in the supply chain. Students will be asked to read and participate in the discussion of articles dealing with progressive operations and supply chain methods. The course also incorporates the case study method, in order to provide students an opportunity to apply their knowledge in class.

MGMT 545 Employment Law for Business (3) The regulation of the employer-employee relationship, discrimination in employment, and the employment environment with respect to managing human resources.

MGMT 545 Employment Law for Business (3)
This course is intended for graduate students who want to learn more about the laws governing the employment practices introduced in a graduate survey course in human resource management. This course will clarify the legal context within which businesses in general, and managers in particular, manage their employees. Students will learn about the legal rights and responsibilities of both employers and employees. Objectives of the course include learning how to comply with workplace laws and regulations, learning how to implement these requirements legally and effectively in an organization, and, as managers of human resources, knowing how to run a safe and fair workplace. To accomplish these objectives, students will evaluate and analyze federal employment laws and regulations, state employment laws (where applicable), and U.S. Supreme Court rulings. The emphasis will be on providing an informed legal context for managerial behavior.

Student achievement of these learning objectives will be evaluated using several methods: students will summarize, interpret, and analyze employment law cases, write and develop a portfolio of critical essays of corporate employment practices, research and present (with team members) a project analyzing a current legal challenge to a specific company employment practice, and prepare a comprehensive written examination of material covered in the course.

**MFGSE 520** Analytical Techniques in Manufacturing and Design (3) Applied statistics, QC, SPC, design for experiments, six sigma, design tolerance and process optimization.

**MFGSE 520** Analytical Techniques in Manufacturing and Design

The Pennsylvania State University
This course will provide the student with an introduction to the use of probabilistic and analytical techniques to optimize process performance and improve product quality. Similarly, these methods can be used to predict reliability and ultimately determine a product life. Additionally, these techniques are integrated into the design process to minimize product failure and rejects. Topics include:

- Statistical Techniques
- Design of Experiments
- Product Design Considerations
- Product Life

Student performance will be evaluated by written reports, quizzes, and exams.

MFGSE 550 Design for Manufacturability I (3) Introduction to DFM, a review of enabling technologies and the systematic use of quality tools during the DFM process.

MFGSE 550 Design for Manufacturability I (3)
This course will provide the student with an introduction to the product design process and techniques used in the design process to optimize product design for both overall quality and minimum cost.

PRODUCT DESIGN PROCESS
- Product fit, competitive analysis, bench marking (2 periods)
- Concurrent engineering (2 periods)
- Process standards (2 periods)
- Value engineering, cost containment methods (2 periods)
- Project management (3 periods)
- Product liability, patents, trade secrets (1 period)
- Design standards (e.g., UL, ASME) (1 period)
- Process standards (e.g., ISO 9000, Q.S. 9000) (1 period)

The topics include:
- Design for Manufacturability
- Design for Assembly
- Enabling Technologies for DFM and DFA
- Quality Tools

Student performance will be evaluated by written reports, quizzes, and exams.

MKTG 441 Sustainability in Marketing Strategy (3) This course examines sustainability in marketing strategy, including real-world applications, green solutions, and using marketing principles to solve social issues.

MKTG 441 Sustainability in Marketing Strategy (3)

This course will examine the growing trend of sustainability and its implications for marketing in today’s world and in the future. It will explore how businesses develop and implement marketing strategies to promote sustainability, and analyze how companies are performing.

Businesses are increasingly applying the concepts of sustainability to their decision-making for marketing strategy. Some firms are leaders in the sustainability movement, and are motivated by ethical conviction to do well for society and the environment. Others find themselves forced by pressure from shareholders, customers, governmental regulation, and peers.

Given this increased attention to the concepts of sustainability by stakeholders, businesses are also looking for future employees with an understanding of the phenomenon.

MKTG 443 Sports Marketing (3) This course will focus on how companies develop, execute and measure marketing strategies and tactics to use sports teams, families, leagues and other organizations to market their products and services domestically and internationally to consumers and business partners. The course will examine the marketing strategies employed by sports teams and leagues.

MKTG 443 Sports Marketing (3)

“Sports Marketing” is designed to explore how various types of businesses and other organizations market products and/or service related to sports as well as how sports are used as marketing platforms for non-sports products. Unique aspects of the sports business will be explored including how strategies and tactics related to marketing in this sector differs from other industries. The purpose of this course is to provide an overview of various aspects of sports marketing.
Graduate Bulletin Archive - 2014

This will include the use of sports as a marketing tool for other products, the marketing of sports products and emerging considerations that are relevant for both marketing through and the marketing of sports. Since sports involves consumers, businesses and other organizations, this course will cover B2C as well as B2B marketing.

How product, distribution, pricing and promotional programs are developed particular to this industry will be one of the primary focuses. Relationship marketing, the role of technology, sponsorships, ambush marketing, partnership leveraging, endorsements, venue naming rights, licensing and emerging legal and ethical issues will also be important focuses.

A guest speaker series will provide additional professional perspectives on a variety of unique aspects of marketing particular to sports. Reading Sports Business Journal, the most highly regarded source of news by sports industry employees, will further expand this knowledge base as will current news events related to the industry. Students will be provided an opportunity to network with guest speakers and those interested in considering sports among their job search, will also be able to receive internship and career counseling from the instructional team. Students enrolled in this class will also be able to submit resumes and requests to be interviewed for internships with various sports organizations being arranged in cooperation with the Smeal College Corporate and Career Services Office.

Students will apply what is being learned in the class to the development of a project related to sports marketing, with the added benefit of having a deliverable which can be used to further the search for jobs and/or internships in the sports business.

MKTG 445 (IL) Global Marketing (3) Role of international marketing in the global environment; political, economic, geographic, historical, cultural conditions; developing and implementing international marketing strategies.

MKTG (I B) 445 Global Marketing (3) (IL)

MKTG/I B 445 focuses on the wide range of issues, which face enterprises as they develop and execute marketing strategies and tactics, designed to support business activities in markets outside their home country. This course deals directly with these issues as they apply to firms, which concentrate on a few markets closer to home, or on many markets throughout the world, including via the Internet. This course also deals with the important role played by governments in shaping the global marketing environment, including through trade policies, treaties and marketing supports. Students successfully completing this course also gain a greater understanding of the cultural, technological, economic, political and social environments which international businesses and global marketers face as they seek to expand their product and/or service offerings into other nations. Understanding this important part of the challenge facing international businesses and global marketers is achieved through the text, lectures, and student group projects and presentations including some focused on specific countries, including both major trading partners of the United States and select emerging new markets. This course is designed for students who have an interest in these topics and/or who plan to enter fields such as international business or global marketing and/or who expect to work for businesses, which are active internationally. Class discussions and projects are designed to help students explore these topics in greater depth. A series of small group assignments and presentations will further help students apply what is being learned via problem-based learning. This is an interactive class. Therefore, a portion of the grade each student achieves will be based on class attendance and participation. Students are also expected to pay attention to examples of the issues discussed in class that they encounter during the semester in print and online communications. Along with material from lectures and the text, issues discussed in class will be included in the exam.

MKTG 475 Innovation and Product Management (3) This course is an application-oriented interdisciplinary course on new product development concepts, and innovation management. The Pennsylvania State University
MKTG 475 Innovation and Product Management (3)

This course is designed to provide students the opportunity to examine and understand the new product development process. It takes the process from the strategy and ideation stage to the after-market product launch. The course blends the perspectives of marketing, management, and engineering into a single approach to product development. It provides students with an appreciation for the realities of industrial new product development practice. Therefore, case studies and other in-class assignments are designed in a way that students can apply the theoretical/abstract concepts to the real life phenomenon. The new product development projects are assigned to teams in real life, students have the opportunity to complete the case analyses and assignments in teams. Course aims to integrate micro level new product development issues (e.g., firm-level product strategy) to macro level issues (e.g., anti-trust regulations and legislations).

MKTG 480 Intermediate Social Media Marketing (3) Social Media Marketing tools, techniques, and strategies to build brands and customers.

MKTG 480 Intermediate Social Media Marketing (3)

In today’s business world, marketers must become more creative in the ways in which they present their company on an Internet based platform such as Twitter, Facebook, and Linked-In in order to present increasingly relevant products and services to a more receptive customer base. The course, Intermediate Social Media Marketing, is designed to provide hands-on experiences with the use of Social Media Marketing tools and techniques while adhering to socially acceptable and ethical standards and protocols.

The technology tools and platforms include but not limited to: Facebook, LinkedIn, Twitter, YouTube, Google+, Pinterest, Foursquare, Friendster, Technorati, Blogs, Vlogs, Podcasts, Hootsuite, Radian6, various search engines, and QR codes. These social media tools can be used to find, reach, connect, and automate marketing messages to efficiently and effectively build relationships, stronger brands and loyalty. These technologies may be utilized with or without a fully realized marketing automation structure, allowing ideas to be shared on a global platform.

Students will learn and apply the major categories of Social Media tools, the how’s and why’s of their use, and decide what venues to use to reach the social media marketing objectives of firms, which may include improving the content to increase online presence, brand awareness, fan likings, customer inquiries, and sales.

During this course, students will devise a social media marketing plan for a local firm (or firms) that addresses (1) platform, (2) content, and (3) interaction. This course will achieve academic excellence by having students research the latest techniques and practices of social media, mobile, and direct marketing to build a social media marketing plan for a local firm (or firms) to expand its markets. Students will be analyzing a firm’s current traditional and social media marketing practices, and short-term and long-term goals for its target markets.
MKTG 485 Business-to-Business Marketing (3) Application of marketing principles to commercial enterprises, industrial firms, government, and other non-profit institutions.

MKTG 521 Scientific Marketing Analysis and Implementation (2) An introduction to the tools used, rationale for, and the practice and implementation of a variety of current marketing techniques.

**MKTG (MS&IS) 521 Marketing Engineering (3)**

This course deals with concepts, methods, and applications of decision modeling to address such marketing issues as segmentation, targeting and positioning, new product design and development, advertising, sales force and promotion planning, and sales forecasting. The course is designed for MBAs as well as for students in engineering and related disciplines who have some background in or understanding of marketing principles, and exposure to spreadsheet programs such as EXCEL.

Unlike conventional capstone marketing courses that focus on conceptual material, this course will attempt to provide skills to translate conceptual understanding into specific operational plans—a skill in increasing demand in organizations today. Using market simulations and related exercises tied to PC-based computer software, students will develop marketing plans in various decision contexts.

Specifically, the course objectives are to:

- Provide students with an understanding of the role that analytical techniques and computer models can play in enhancing marketing decision making in modern enterprises.
- Improve students’ skill in viewing marketing processes and relationships systematically and analytically.
- Expose students to numerous examples demonstrating the value of the analytic approach to marketing decision making.
- Provide students with the software tools that will enable them to apply the models and methods taught in the

The Pennsylvania State University
The course will be of particularly valuable to students planning careers in marketing and management consulting. The course is designed for students with some background in quantitative methods as well as some exposure to basic marketing concepts.

Class sessions will be devoted to probing, extending and applying the material in the readings and the cases. We will use the "Tell-Show-Do" sequence to give you hands-one experience in using the course materials for making marketing decisions. It is your responsibility to be prepared for each session as detailed in the course outline. Each one of you will benefit from belonging to a "study group" that meets and prepares for each session before coming to class.

Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MKTG 532 Brand Management (2) To examine and understand the processes of building, designing, measuring, and maintaining brand equity.

**MKTG 556** Marketing Management (3) To explore the conceptual and applied dimensions of marketing management.

**MKTG 556 Marketing Management (3)**

This course is a seminar course, so class involvement will be a major component. In addition, students will be expected to prepare two papers. The first will be a journal submission review; the second will be the written version of each student’s research proposal. Academics need to understand journal reviewing, and they need to develop research ideas and write about them. Students will also be expected to prepare and perform two oral presentations. The first will be the presentation discussed in the session description below and will be a part of their class participation. The second will be an oral form of the student’s research presentation. Students need to be able to communicate their ideas, and it is hoped that having an oral presentation of their proposals before the written presentation will also help them improve their proposal. Finally, there will be an examination at the end of the course.

Each class session, with the exception of the first and last class periods, will be devoted to an important topic in the marketing management domain.

For each class period, other than the two exceptions, students will read around 7 papers. The papers will be a mix of
classical, seminal works and recent, cutting-edge works in the assigned area. The bulk of the class period will be devoted to discussion of the articles assigned. Discussion will be devoted to a) why the article is important, b) good points of the article, c) bad points of the article, and d) research ideas that the article might suggest or engender. In addition, one student per week will be responsible to find, prepare, and present another published paper that deals with the weeks’ issues; this presentation will be part of the student’s participation grade. The last few minutes of each class will be devoted to a discussion by the instructors of where research in the assigned area is going and some interesting open research questions in the area.

The two exceptions among the class periods will be the first and last class. In the first class, we will have an introduction to research in marketing management and this particular Ph.D. seminar, while the last class will be devoted to allowing the remaining students to present their research proposals.

Marketing-CI (MRKT)

MRKT 513 Marketing Management: Structures and Processes (2) This course examines concepts, techniques, and developments of strategic marketing plans and programs within domestic and international market environments.

MRKT 513 Marketing Management: Structures and Processes (2)

As an important functional area of business, Marketing Management: Structures and Processes course equips MBA students with the concepts and techniques that are necessary for the development and application of marketing programs, plans, and strategies. As such, the major focus of the course will be on analysis of the market opportunities, development of strategic marketing plans both at domestic and global level, organization of the activities of the participants, implementation of the marketing plans, and control of the marketing activities. Furthermore, important issues of social responsibility and marketing ethics will be explored. This course will deal with marketing strategies of brick-and-mortar and on-line companies.

The course replaces our existing 3 credit MRKT 520 - Marketing Management course. Students will be evaluated by using group case assignments, Internet marketing exercises, mini research assignments, marketing plan exercise and a final exam. The course does not require special facilities. It will be offered twice a year.

MRKT 514 Marketing Management: Relationships and Institutions (2) Examination of relationships formation with customers and distribution channels; traditional and on-line marketing issues.

MRKT 514 Marketing Management: Relationships and Institutions (2)

MRKT 514 provides MBA students with concepts and techniques necessary for the development of customer satisfaction and value. The major focus of the course is on the analysis of relationships and total quality marketing. The role of actors in the distribution and supply chain is explored conceptually as well as analytically. In addition, important issues of marketing for not-for-profit organizations, Data based marketing are explored. Finally, the course will conclude with applications of marketing concepts and techniques of on-line marketing and electronic commerce.

MRKT 570 Marketing Strategy and Planning (3) Analysis of management's marketing problems, including marketing analyses, pricing, channels of distribution, promotion, competition, product strategies, and marketing research.

This course is intended to provide graduate students with the conceptual background and the analytical tools that are used in solving strategic marketing problems. The text and assigned readings furnish the conceptual background for effective analysis of marketing problems; the cases utilize practical application tools for making strategic marketing decisions. To operationalize this objective, class discussion will be geared toward evaluating marketing information to comprehensive and integrated marketing strategies. These discussions will nurture students' understanding of the operation of marketing programs; will emphasize theory; and, will foster the integration of the various marketing management elements into a comprehensive marketing strategy.

MRKT 571 Consumer Behavior (3) Factors influencing buyer behavior; contributions of the behavioral sciences to the study of selected phenomena.

This course is intended to introduce graduate students to the basic theoretical ideas and techniques of investigations into consumer behavior phenomenon. Such a study will, it is hoped, provide an appreciation of the problems of consumer behavior and the techniques available for their solution. Specific objectives are:
(a) The prepared graduate students who will enter a wide range of careers with a substantial knowledge of consumer behavior theory, research, and state-of-the art conclusions, that will permit them to use more sophisticated analytical techniques in anticipating and meeting consumer needs and demand.
(b) To offer strategic how-to, and "insider" information for using theoretical concepts and techniques and give graduate students specific opportunities, within the course.

MRKT 572 Marketing Research (3) Management information needs, evaluation of research proposals and findings, methods of data collection and analysis, integration of research and decisions.

This is a graduate level Marketing Research course and deals with collection, processing, analysis and interpretation of information, which are main steps in completing a successful market research project. The course provides students with an understanding of marketing research and its is designed in the belief that one must understand market research jobs and use it effectively in managerial decision-making. It is practical oriented and aligned with scientific, scholarly and logical truth. The course will cover the research process including problem identification, secondary and primary data collection questionnaire design, sampling, coding process, research methodology, data analysis and interpretations, and communication with management through research reports and presentations.

MRKT 585 Business-to-Business Marketing (3) Marketing of products and services to other businesses and organizations including strategy, planning, research, communications, pricing, distribution, and global issues.

This course builds upon marketing management concepts and focuses on the special elements and requirements of
business-to-business marketing. Emphasis is given to managerial decision-making in the areas of business marketing environment, business buying functions, business marketing strategy, business marketing systems, business marketing planning, business marketing research, business marketing segmentation and demand analysis, product strategy in business marketing, business marketing communications, promotion, pricing, and distribution and globalization strategy in business marketing. The course employs real marketing situations treated analytically and emphasizing business marketing situations. In order to present the materials in a real life environment, case problems from business-to-business marketing will be used. Heavy student preparations and participation are expected. The course will also cover business marketing strategies on the Internet.

MRKT 586 Internet Marketing (3) Concepts, techniques, and applications of Internet marketing; buyer behavior; Web site design; marketing plans; legal, ethical, and international environments.

MRKT 586 Internet Marketing (3)

With the introduction of the Internet and the World Wide Web, the marketing field has moved to a new stage in meeting the demands of current and prospective customers. In this respect, many companies have added a new medium of delivery and promotional channel to their existing brick and mortar operations. This course will deal with marketing strategies of click-only and click-and-mortar firms. The course is a valuable addition to our marketing course offerings in our MBA program. It is a marketing course, and will not deal with technical aspects of the Internet. Students will be evaluated by using group assignments such as development of Web Marketing plans, case studies, mini research assignments, and a final exam. The course does not require special facilities except desktop computer and MS software, which are available in many of our classrooms. It may be offered once a year.

MRKT 587 Global Marketing (3) Exploration of strategic marketing planning concepts and techniques from a global perspective within diverse overseas market environments.

MRKT 587 Global Marketing (3)

This course is a systematic treatment and application of marketing management knowledge on a global scale. The objective of the course is to develop knowledge and understanding of the global marketing environment and of concepts, tools, and theory that will prepare students to take responsibility for successful global market penetration. The perspective of the course is managerial: i.e., the ability to identify market opportunities, develop plans/programs, resolve problems, and implement strategies. This course will provide graduate students with an understanding of marketing planning and strategy from a global perspective. The world should be viewed as a marketplace with a resulting need for familiarity with various environmental similarities and/or differences. These may necessitate adaptation and/or standardization of marketing programs, strategies and plans from region/nation to region/nation. A major focus of this course will be a strategic marketing management techniques, issues, strategies and problems within a global marketing framework. As well, an understanding and appreciation of world cultures, socioeconomic, and legal/political conditions which have a profound effect on a US firm's target market selection and marketing strategy development, will be established.

MATSE 403 (BME 443) Biomedical Materials (3) Describe properties of materials and composites and their in vivo interactions.

**Biomedical Materials (3)**

Metals, polymers, and ceramics, and their composites, which are capable of emulating the functions of hard and soft tissues, are the subjects of this course. The subject matter shall be confined to implanted materials; external appliances, such as casts, braces, etc are not considered. The topical content of this course will be grouped into four areas. A general introduction to selected aspects of physiology will be presented. This will provide the background necessary to appreciate the factors which govern the selection of biomedical materials. Specific emphases will be placed on polymerization of biopolymers (polypeptides and polysaccharides) and the general relationships between conformation and biological function, the biochemistry of blood and blood surface interactions, the formation of teeth and bone and the relationships between microstructure, composition and function, the immune responses to implanted materials, the resorption of bone (osteoporosis) and the development of caries. The perspective placed on these topics will be that of materials science.

The selection of ceramics for hard tissue prostheses will be discussed. Orthopedic and dental applications for ceramics will be described. Specific ceramic materials to be treated include dental porcelain, alumina- and zirconia-based ceramics, and bioglasses and pyrolytic carbons. Various classes of inorganic cements, gypsum, zinc phosphates, zinc carboxylates, silicates, and glassionomer cements will also be considered as ceramics. Hydroxyapatite, Hap-based composites and Hap-metal interactions will be discussed. The fracture toughness of metals, their electrochemical responses in vivo, and the nature of the interfacial interactions with hard tissues will be treated. Dental amalgams and the noble metals for dental applications will be considered. Metals and alloys, such as Ti, Co-Cr, and vitallium, used in prosthetic applications, will be described and their properties and limitations discussed. The phenomenon of stress shielding and the immune responses associated with the accumulation of metallic and polymeric particular debris in the vicinity of an implant will be discussed in particular. Polymeric materials are important in a broad range of biomedical applications. Among these are soft tissue prostheses, hemostatic agents, dental restoratives, bone replacement materials, and surgical adhesives. In some applications it is desirable that a polymeric material biodegrade while in others property retention is desirable.

Hydroxyapatite, Hap-based composites and Hap-metal interactions will be discussed in particular. Relationships among physical properties, mechanical properties, and chemical interactions with biological fluids will be described. Dental and orthopedic applications of metals will be described. The fracture toughness of metals, their electrochemical responses in vivo, and the nature of the interfacial interactions with hard tissues will be treated. Dental amalgams and the noble metals for dental applications will be considered. Metals and alloys, such as Ti, Co-Cr, and vitallium, used in prosthetic applications, will be described and their properties and limitations discussed. The phenomenon of stress shielding and the immune responses associated with the accumulation of metallic and polymeric particulate debris in the vicinity of an implant will be discussed. Among these are soft tissue prostheses, hemostatic agents, dental restoratives, bone replacement materials, and surgical adhesives. In some applications it is desirable that a polymeric material biodegrade while in others property retention is desirable.

**MATSE 404 (IL) (BME 444) Surfaces and the Biological Response to Materials (3)**
Focus is on the special properties of surfaces as an important causative and mediating agent in the biological response to materials.

**MATSE 404 (BIOE 444) Surfaces and the Biological Response to Materials (3)**
This course factors the classical picture of the biological response to materials into spatial and temporal components, identifying the special properties of surfaces as an important causative and mediating agent. Biophysical mechanisms are emphasized that lead to formulation of structure property relationships and the biological response to materials. Contact activation of the blood plasma coagulation cascade, bioadhesion, and protein adsorption are used as example biological responses to material surfaces to illustrate concepts and principles. Leading theories attempting to correlate both kind and intensity of biological responses to surface and interfacial energetics will be compared and contrasted through a process that will quantify important surface thermodynamic properties of materials. The hydrophobic effect and related phenomena, especially as this pertains to water solvent effects in biology, receives special emphasis. Course materials are drawn from a selection of relevant library reserve texts.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATSE 409 (NUC E 409) Nuclear Materials (3)**

Nuclear reactor materials: relationship between changes in material properties and microstructural evolution of nuclear cladding and fuel under irradiation.

**MATSE (NUC E) 409 Nuclear Materials (3)**

MATSE/NUC E 409 provides a background on the types of materials used in nuclear reactors and their response to neutron irradiation. Most of the materials problems encountered in the operation of nuclear power reactors for energy production are discussed here. The objective of the course is to give nuclear engineering students a background in materials so they understand the limitations put on reactor operations and reactor design by materials performance. In the first part of the course, we review basic concepts of physical metallurgy, to develop a mechanistic and microstructurally based view of material properties. In the second part of the course, we present the methods to calculate displacement damage to the material produced by exposure to neutron irradiation. The microstructural evolution that results from the reactor exposure (including radiation damage and defect cluster evolution, and changes) is described. The aim is to create a linkage between these changes at the atomistic level and the changes in macroscopic behavior of the material. Special attention is given to property changes that affect fuel performance and operational safety. Both mathematical methods and experimental techniques are emphasized so that theoretical modeling is instructed by experimental data. Students use the TRIM and SPECTER codes to quantitatively evaluate neutron damage, as well as learn simple analytical models that describe microstructural evolution and property changes under irradiation.

Effective: Summer 2002
Prerequisite:

**MATSE 410 Phase Relations in Materials Systems (3)**

Phase rule; construction and interpretations of equilibrium diagrams; importance of nonequilibrium in materials.

**MATSE 410 Phase Relations in Materials Systems (3)**

This course integrates three core components of materials science and engineering: thermodynamics, kinetics, and interface crystallography in understanding processing and development of inorganic materials. It is the key course bridging the fundamentals to practical materials processing. Phase equilibria, phase diagrams, phase transformations and heat treatments are addressed in great details through nucleation, transformation kinetics, crystal interface and diffusion. The complexity of materials is discussed in hierarchy from pure elements, binaries, ternaries to multicomponents.

MATSE 411 Processing of Ceramics (3) Principles of ceramic processing, including powder preparation and characterization, forming operations, and the basic phenomena underlying these operations.

MATSE 411 Processing of Ceramics (3)

This course covers the scientific and engineering principles of manufacturing of ceramic products. The course covers powder synthesis and characterization; surface and colloid chemistry; fabrication; and densification by sintering. There is an emphasis on the physical chemistry of particulate systems as relates to the various stages processing. The course is offered every fall semester and is required for BS graduates of the Ceramic Science and Engineering option in Materials Science and Engineering.

The course objectives are for the student to (1) become knowledgeable of all steps involved in ceramic manufacture from powder synthesis through final densification by sintering, (2) understand the rationale and compromises for selecting a given processing route, (3) understand and be able to apply the parametric relations for manufacture of a ceramic with a specified microstructure, and (4) understand the physical chemistry fundamentals responsible for the unique properties of fine powders.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2005
Prerequisite: MATSE 401

MATSE 412 Thermal Properties of Materials (3) Thermal Properties of Materials (3)

The fundamentals of achieving, measuring, and controlling high temperature for materials processing are addressed. The crystal physics underlying heat capacity, internal energy, phonon and photon conduction, and thermal expansion is used to rationalize the behavior of a wide variety of ceramic and metallic materials in severe thermal environments. Micro- and macroscopic thermal transport, thermal shock and fatigue behavior, and thermochemical durability are addressed insofar as their impact on the design of, and with, high performance materials in thermostructural applications.

Case studies on materials selection and design using the fundamentals of inorganic crystal chemistry, physics, thermodynamics, kinetics, elastic, and mechanical properties are widely employed. Students interested in disciplines such as metallurgy, ceramic science, electronic and photonic materials, mechanical engineering, aerospace engineering, industrial engineering, engineering science, and chemical engineering will benefit significantly from this course.

Prerequisite: Concurrent: MATSE 401

MATSE 412 Thermal Properties of Materials (3)

The fundamentals of achieving, measuring, and controlling high temperature for materials processing are addressed. The crystal physics underlying heat capacity, internal energy, phonon and photon conduction, and thermal expansion is used to rationalize the behavior of a wide variety of ceramic and metallic materials in severe thermal environments. Micro- and macroscopic thermal transport, thermal shock and fatigue behavior, and thermochemical durability are addressed insofar as their impact on the design of, and with, high performance materials in thermostructural applications.

Case studies on materials selection and design using the fundamentals of inorganic crystal chemistry, physics, thermodynamics, kinetics, elastic, and mechanical properties are widely employed. Students interested in disciplines such as metallurgy, ceramic science, electronic and photonic materials, mechanical engineering, aerospace engineering, industrial engineering, engineering science, and chemical engineering will benefit significantly from this course.
MATSE 413 Solid-State Materials (3) Structures of metallic, ionic, and covalent solids, amorphous materials, and surfaces; electronic structure; electronic properties of solids and their manipulation.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATSE 415 Introduction to Glass Science (3) Composition, melting, fabrication, properties, and uses of glass; combinations of glass with metals and other materials.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATSE (E SC) 417 Electrical and Magnetic Properties (3) Electrical conductivity, dielectric properties, piezoelectric and ferroelectric phenomena; magnetic properties of ceramics.

MATSE 417 is designed to provide students with a fundamental understanding of the different responses a material can have to applied electrical or magnetic fields. Important properties are introduced and correlated with knowledge of material chemistry, crystal structure, and microstructure to provide an understanding of the mechanisms responsible for controlling the observed properties, as well as the ways in which properties can be engineered. Electronic and magnetic properties encompass dielectric, ferroelectric, conductor, superconductor, and ferromagnetic materials. Material properties and structures are related to sensors, energy storage and conversion devices, biomedical devices and electronic components in telecommunications.
MATSE 417 (E SC 417) Electrical and Magnetic Properties (3) Electrical conductivity, dielectric properties, piezoelectric and ferroelectric phenomena; magnetic properties of ceramics.

MATSE (E SC) 417 Electrical and Magnetic Properties (3)

MATSE 417 is designed to provide students with a fundamental understanding of the different responses a material can have to applied electrical or magnetic fields. Important properties are introduced and correlated with knowledge of material chemistry, crystal structure, and microstructure to provide an understanding of the mechanisms responsible for controlling the observed properties, as well as the ways in which properties can be engineered. Material properties and structures are related to sensors, energy storage and conversion devices, biomedical devices and electronic components in telecommunications.

MATSE 419 Computational Materials Science and Engineering (3)

Modeling is a critically important tool in the field of materials. This course is designed to inform students about all areas of materials modeling, and to explore the use of modeling in different research areas. This is a hands-on undergraduate level course, mandatory for all MATSE students, covering current methods for modeling soft and hard matter, at the atomistic, meso and continuum scale levels. It consists of an overview of individual techniques of modeling from atomistic molecular dynamics and Monte Carlo, coarse-grained molecular dynamics, and multiscale modeling, to the continuum (e.g., SAFT, CALPHAD). It also includes a computer laboratory component with hands-on exercises. At the conclusion of the course, students will understand the physical basis and basic procedures of each technique. Students will be able to understand the general literature in modeling and its connection with experimental work, as well as to communicate with experts in the field. From the laboratory practices, they will learn how the individual modeling techniques contribute to knowledge in each area, and to interconnect them with experimental information.

MATSE 421 Corrosion Engineering (3)

This variable 2 or 3-credit course is an introduction to the corrosion field and more broadly to the principles of electrochemistry and to the electrode reactions that occur during the undesirable corrosive degradation of metal, and also in various important commercial processes such as electroplating, electroless plating, battery and fuel cell operation, aqueous extraction metallurgy and corrosion prevention techniques. The objectives of this course are to introduce the student to the (1) principles of electrode reactions, (2) nature of commercial corrosion resistant alloys and their compositions, (3) various forms of corrosion and preventative measures, and (4) design of electrochemical laboratory and field procedures for detecting corrosion processes and determining their rates. Thermodynamic and rate data are used to make engineering decisions relative to the occurrence of corrosion, to the effectiveness of the various preventative measures, and to electrochemical design. Corrosion processes and electrode reactions more generally are primarily concerned with the surface properties of materials, but the bulk properties, such as microstructure, grain size, hardness, and composition, are discussed in terms of their impact on materials degradation. In-class closed-book exams and problem sets, and homework that allow student collaboration, are used for evaluation. Computer access to the course is available and includes all lecture material, old exams with answers, home works, and syllabus on the Web. This course is offered every year with typical class size of less than 20 students. The 2-credit version is required in the Metals Science and Engineering curriculum. The 3-credit version includes additional lecture material and some laboratory demonstrations; evaluation included a lab report.

The Pennsylvania State University
MATSE 422 Thermochemical Processing (3) Physico-chemical aspects of high temperature extraction and processing of metals and alloys. Design and evaluation of processes and process options.

MATSE 424 Materials Selection and Design (1) Introduction to the selection and design of materials for structural applications.

MATSE 425 Processing of Metals (3) Modern methods of shaping metals in liquid and solid states: casting, joining, powder and deformation processing. Design of new technology.

MATSE 426 (MN PR 426) Aqueous Processing (3) A study of the chemical and engineering principles pertinent to metal processing in aqueous systems: hydrometallurgical extraction, plating, materials preparation.
metal extraction from primary and secondary sources, electroplating, and metal finishing, powder synthesis, energy storage and conversion, and treatment of recycling of metal-containing toxic wastes.

1. Physico-Chemical Principles - Thermodynamic, chemical kinetic and transport factors which control hydrochemical processes (leaching; precipitation; adsorption; solvent extraction; ion exchange; electrowinning, electorefining and electroplating; membrane processes; energy storage and conversion); graphical representation of homogeneous and solid/solution equilibria; chemical reagents.

2. Engineering Principles - Reactor design and staged operations; ideal batch, continuous stirred-tank and plug-flow reactors; fluidized bed reactors; electrochemical reactors; multistage separation processes (solid-liquid, liquid-liquid, and gas-liquid systems).

3. Process Synthesis - Design of metal separation (extraction, refining, waste treatment) materials synthesis, metal finishing, and energy storage/conversion processes and system-integration of unit operations, industrial practice. Emphasis on closing circuits to minimize or eliminate waste effluents.

MATSE 430 Materials Characterization (3) Elements of crystallography and the characterization of crystalline and non-crystalline materials using x-ray diffraction, electron microscopic, and other instrumental techniques.

MATSE 430 Materials Characterization (3)

This course will introduce students to characterization techniques for quantifying microstructure, chemistry and atomic structure of solid state materials. Elastic and inelastic interactions of radiation (e.g. electromagnetic and electrons) with solid state materials are the basis for most characterization techniques. Utilizing these interactions it is possible to obtain structural and chemical information from materials, often at small length scales. In this course, students will be introduced to the most common imaging, diffraction and spectroscopy techniques used for materials characterization. They will develop an understanding of the underlying physics behind the techniques to enable interpretation of the data. The course will be beneficial for any student interested in solid-state materials, as it provides a key component of the processing-structure-properties process.

MATSE 436 Mechanical Properties of Materials (3) Fundamental relationships between structure and mechanical behavior of materials.

MATSE 436 Mechanical Properties of Materials (3)
The topics covered in this course are essential to students in the Materials Science and Engineering options, and these are also required for materials engineering courses nationally accredited by the professional societies. The course is taught at the 400 level because it requires the fundamental courses in mathematics and physics to be completed. The course also requires completion of an introductory course in materials science. This new course typically fits into the junior or senior year, when students in the major are understanding how the properties of materials can be changed by controlling the structure of materials. The course has also been designed such that students in other engineering majors can take this course as a technical elective. Some of the information in this course is used in laboratory courses for the major. The course is not required as a prerequisite for other courses.

MATSE 444 Solid State Properties of Polymeric Materials (3) \( \text{Structure/property relationships in the bulk solid state of polymers. Characterization of bulk properties and structure.} \)

MATSE 444 Solid State Properties of Polymeric Materials (3)

Prerequisite is PLMSE 406. Understanding relationships between structure and properties in the bulk solid state of polymers is important in designing and utilizing polymers in many applications. In trying to understand 'structure' we also need to define what is meant by and important in 'structure' and review tools used to measure desired structural features. Two-thirds of the course addresses accepted general features of the polymeric solid state, with particular emphasis on characterization of semicrystalline polymers since semicrystalline polymers represent approximately 75% of industrially important polymers. In this portion of the course, we will be particularly concerned with defining and measuring percentage crystallinity and with defining and measuring orientation in polymers. Both of these parameters play important roles in establishing physical characteristics of polymers, in particular in mechanical properties. Mechanical properties continues to be an important feature for polymers since polymers posses the widest available range of mechanical properties of any material. The remainder of the course covers new and/or continuing topics selected from composition-branching distribution; barrier properties of thin films and recycle-degradation of polymers.

**MATSE 448 (CH E 442) Polymer Processing Technology (3)**
Basic principles of polymer melt processing are reviewed and subsequently applied to the most important industrial processing operations.

**MATSE 448 (CH E 442) Polymer Processing Technology (3)**
MATSE 448 involves both lectures and laboratory experiments illustrating the interrelations between structure, processing conditions, and physical properties of industrial polymer products. Students apply engineering fundamentals and principles of polymer melt rheology to analyze industrial processing operations. Unlike typical polymer processing courses offered at most U.S. universities, MATSE 448 covers detailed analyses of individual processing operations, rather than dwelling on underlying polymer science fundamentals that are covered elsewhere in our curriculum. Students learn to optimize processing variables, given a particular set of materials and conditions, establishing how processing conditions impact the physical properties of finished polymer products. We explore the physics governing processing operations including extrusion, mixing, calendering, blow molding, thermoforming fiber spinning compression molding, injection molding, and nanolithography.

**MATSE 460 Introductory Laboratory in Materials (1)** An introduction to comparative physical properties and characteristics of various materials including mechanical, electrical, thermal, and structural morphology.

**MATSE 460 Introductory Laboratory in Materials (1)**

This is a lab course whose goal is to provide an integrated approach to materials science and engineering. Any individual lab will consist of a number of elements, initially students will be provided with a presentation summary of the proposed lab. This could be film, video, web delivery, hard copy or live presentation. Presentation time will be limited but should be reviewed before students attempt the hands-on lab. All labs will examine a variety of different materials including metal, ceramics and polymers. Labs will be integrative in the sense that they will include use of spreadsheets, data plotting, and presentation of results as written reports and/or as a "PowerPoint" presentation. The labs selected have been chosen specifically because they cut across all current basic materials disciplines. These labs are intended to provide students with a broad appreciation of the range and contrast of material structures and properties, in order that students more fully appreciate the breadth of material science and engineering.

MATSE 472 Metallurgy Laboratory II (1) Application of principles of mechanical metallurgy, pyroprocessing, corrosion and metal processing.

MATSE 472 Metallurgy Laboratory II (1)

This course provides a range on laboratory experiences ranging from metals processing to alloy properties. A primary course objective is to demonstrate important relationships between the processing, microstructure, and properties of metals. The individual laboratory practices include the following: powder metallurgy, metal casting, mechanical property testing and analysis, welding and weldment characterization, non-destructive testing, failure analysis and fractography, computational processing design, corrosion, and aqueous processing. The course requires hands-on involvement by the students in the design and planning of experiments as well as data acquisition and analysis of results. Students work in groups, and written reports are the primary basis for grading.

MATSE 474 Polymeric Materials Laboratory--Characterization (1) Principles and practices involved in determination of properties, structure and morphology, employing thermal, mechanical, spectroscopic, viscometric and computer techniques.

MATSE 474 Polymeric Materials Laboratory--Characterization (1)

Prerequisite for the course is MATSE 443. This course introduces the student to a series of simple physical and physical-chemistry tests on polymers that are the basis for a wide range of more complex tests routinely carried out in industry. In addition to the tests listed below students are also instructed in preparation of lab reports and in some of the typical problems associated with presenting data. A final report utilizes data collected by a number of different student teams throughout the course of the lab. Finally, students are demonstrated a number of state-of-the-art characterization tools used specifically to determine properties of interest in the polymer area. Grading is based on written lab reports (10% for each of 8 separate reports and 20%) for a final comprehensive report using data from other groups as well as the student's own group.

Course content
Injection Molding - students work with a simple injection molder to find optimum molding conditions to prepare sample bars for mechanical testing.
Static Mechanical Testing - an Instron is used to determine modulus, yield, and elongation to break for samples prepared above and for other materials.
Izod Impact Test - injection molded samples are used to measure notched impact tests on what are typically tough materials.
Dilute Solution Viscometer - standard solution viscosity tests are used to measure intrinsic viscosity of polymer solutions and (viscosity average) molecular weight.
Melt Viscometer - melt index and ‘die swell’ are easily measured with a simple ram and die ‘melt indexer’ as a measure of processibility.
Optical Microscopy - some semi-crystallizable polymers produce large enough spherulities that rate of crystallization can be followed optically.
Elasticity - a simple experiment measuring the retractive force of an elastic band as a function of temperature shows the entropic origin of elasticity.
Copolymerization Computer
A computer program (VI) allows students to try a wide variety of ‘what if’ experiments to measure the effects of a range of copolymerization parameters.

Effective: Spring 2008
**Prerequisite:**

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATSE 483 (E SC 483) Simulation and Design of Nanostructures (3)** Introduction to computer simulation techniques and their applications at the physical/life sciences interface.

**MATSE (E SC) 483 Simulation and Design of Nanostructures (3)**

Students will learn the simulation techniques and the design rules of nanostructures. Basic concepts of computer modeling will be introduced using quantum and classical approaches. Fundamental physical phenomena encountered in the molecular fields of computational physics, chemistry, and biology will be studied. Applications are drawn from a broad range of fields including soft and condensed matter to build an understanding of nanostructures.

The course will assume knowledge and skill developed in the prerequisite courses of PHYS 214 and MATH 230. Students are expected to combine knowledge from other courses with information presented here to develop sophisticated interpretations and understanding of physical and chemical principles of nanostructures and their design rules.

Evaluation methods to be used in this course will be two in-class examinations and one final period examination. The course contains a computer code generation and implementation component. Students will use commercial or educational computer codes (e.g., Matlab, Mathematica, AMBER, CHARMM, VASP, etc.) which are available at our high performance computing clusters (http://gears.aset.psu.edu/hpc/). Students will use the computing clusters to perform simulations which are accessible from any classroom or laboratory at Penn State.

The principal objectives of the course is to learn the fundamental physics of nanostructures and to design them with computer simulations. This approach starts from classical molecular dynamics that apply on the large scale biological and synthetic assemblies and encompasses quantum mechanics for the molecular and atomic sizes. This course will give a broad scientific picture of simulation techniques in the area of nano-science and technology.

A course focused on international research, specific design and methodology, facilitated through the International Internship in Materials and Program.

**MATSE 484W International Internship in Materials: Research Definition and Methodology (3) (IL)**

The objective of this course is to enrich our students' preparation for careers in materials science and engineering in a global environment. The course is intended as a follow-up to MATSE 484W: International Internship in Materials: Research Definition and Methodology, in which the student will complete the research and documentation on the topic developed in that course. It may be used as a direct substitution for MATSE 494W: Research and Design Senior Project in the degree...
requirements for Materials Science and Engineering. The course will continue the student's development of international communication skills and appreciation of cultural and technical issues associated with conducting research in overseas laboratories. Students will complete their research experimentation, data analysis and interpretation under the supervision of a Materials Science and Engineering faculty mentor and a mentor from their host overseas laboratory or University. Students will compile a written thesis encompassing their technical findings, with specific emphasis on the economic, manufacturability, sustainability, environmental, safety/health, social and political issues of relevance to the topic. It is expected that the students will carefully and comprehensively articulate and consider the cultural, social, and scientific differences and similarities they experienced in performing the research in an international venue.

MATSE 492W Materials Engineering Methodology and Design (3) Designed to familiarize students with the literature and technology developments in the use of, and design with, materials in industrial applications.

The objective of this course is to teach students the skills to solve realistic problems related to the use of materials in industrial practice. This will be accomplished by considering alternatives for materials design or selection and proposing the most effective scientific or engineering solutions. The methodology will take into account other forces acting on the design process, such as economic, environmental, sustainability, manufacturability, ethical, health and safety, social and political concerns. Students will develop these design skills by working in teams on projects defined by industry, and will learn to communicate their solutions in verbal and written form. Students will also learn the key features needed in developing a team approach to solving problems.

Typically, evaluation is based on written reports, performance in presentations, and instructors’ assessment of the student’s participation in design team activities. At the conclusion of the course, each student will select a design or independent research topic for their capstone senior-year design project.

MATSE 493W Materials Science and Engineering Multidisciplinary Capstone Design Project (3) This course focuses on multidisciplinary industry-sponsored and community service-based design projects offered in conjunction with the

The Pennsylvania State University
MATSE 493W Materials Science and Engineering Multidisciplinary Capstone Design Project (3)

This course will provide students with the opportunity to learn the design process in the context of an industry-sponsored or community service-based design project that demands they produce a working solution. The design projects in this course will be structured for students from two or more different engineering majors, as defined by the project sponsors in collaboration with the instructor and departmental project coordinators. The project sponsor will provide the technical expertise for the project, a clear definition of all project deliverables that are expected, and the financial support to cover needed materials and supplies and travel costs. Project sponsors will be invited to attend the Project Kickoff at the start of the semester to present their ideas and answer questions from the students as well as the Design Showcase at the end of the semester where teams display their results to the project sponsors and the public. The Center for Engineering Design and Entrepreneurship (CEDE) in Hammond Building and the Bernard M. Gordon Learning Factory will provide the facilities where the design teams can work together to develop the design concept and prototype solutions. Faculty members in the School of Engineering Design, Technology, and Professional Programs (SEDTAPP) will administer the course, including reading, evaluating, and grading the final project report, provide lectures on topics including on project management, design, product manufacturing, intellectual property, engineering ethics, societal/global/contemporary/professional issues, and related technical topics, and organize invited technical lectures related to industry projects. In accordance with standard Learning Factory procedures, specific multidisciplinary projects will be selected for this course to provide challenging senior-year design experiences for all students, and the Director of the Learning Factory will coordinate the selection of these projects with the course instructor prior to the start of each semester of the course offering. Multidisciplinary teams will be formed based on specific project needs (i.e., expertise from two or more disciplines based on the project scope).

MATSE 494W Research and Design Senior Project (1-3) Continuation of a research problem in materials culminating in a bound thesis describing the work.

MATSE 494W Research and Design Senior Project (2)

This course continues the senior thesis research topic addressed by the student in MATSE 493W. This is a capstone research/design project which integrates: a) background literature search with articulation of a research hypothesis, b) design and implementation of an experimental plan to test the hypothesis, and c) conclusions regarding the validity of the hypothesis based on the experimental data obtained in the course of the research.

The main characteristic of this course is the performance of the research plan articulated in MATSE 493W, followed by interpretation of the data in the context of the original hypothesis(es). Laboratory research is generally performed in collaboration with faculty and graduate research assistants, using equipment and facilities in a wide range of laboratories throughout campus. Occasionally, the nature of the research may require the student to collaborate with researchers outside of Penn State, perhaps even spending some time in residence at other facilities.

The course culminates in the preparation of a bound thesis detailing the relevance and findings of the research. Assessment of the student's progress is via grading of all components of the thesis (literature review/background, statement of the problem, design of the experimental plan, results and discussion, conclusions, recommendations for future work, and references/appendices), as well as the diligence of the student in performing the experimental research in a professional and timely fashion. The course is offered each semester to allow for differing schedules for students following the conventional MATSE curriculum versus those who have elected to participate in the Cooperative Education program.

MATSE 501 Thermodynamics of Materials (3) Application of thermodynamics to materials equilibria and processes, including solution theory, electrochemical processes, capillarity, and the effect of stresses.

MATSE 501 Thermodynamics of Materials (3)

The goal of this course is to teach the fundamental principles of thermodynamics of materials from a practical viewpoint - thermodynamics as a “toolbox” to help understand chemical behavior of materials. It attempts to integrate chemistry, phase equilibria, and thermodynamics of a materials system as different means of describing the same chemical behavior. It develops quantitative relationships among them. Thermodynamic terms/values are defined in terms of measurable quantities such as temperature, pressure (partial pressures), and concentrations to diminish the abstract nature of thermodynamics. The course emphasizes problem solving, and more specifically, developing explanations and understanding of chemical and thermal behavior observed in the laboratory/industry. A integral part of the course is to teach the use of state-of-the-art equilibrium thermodynamics computer software as an aid in performing calculations, particularly those involving chemically complex systems with many species.

MATSE 505 Irreversible and Statistical Thermodynamics of Materials (3) Introduction to statistical and irreversible thermodynamics as applied to chemical and materials systems.

MATSE 505 Statistical and Irreversible Thermodynamics (3)

This course will introduce students to statistical and irreversible thermodynamics as models of describing equilibrium and rate processes starting from the atomic/molecular level. The course will begin with a review of relevant concepts from classical thermodynamics, including the four laws, entropy, Gibbs and Helmholtz functions, and chemical and electrochemical equilibrium. The formulation of classical thermodynamics does not require the existence of atoms, as it is largely concerned with average, bulk properties and, indeed, much of classical thermodynamics was developed before the existence of atoms, and molecules was accepted unequivocally in the scientific disciplines. However, knowledge of the properties of atoms and molecules allows one to predict the thermodynamic properties of bulk materials through the discipline of statistical thermodynamics (statistical mechanics) in an ab initio manner. Indeed, many tabulated thermodynamic properties, particularly for unstable systems, have been calculated rather than measured. Finally, we live in an irreversible world (i.e., one that evolves, such that the entropy of the system and surroundings continuously increases), and statistical thermodynamics cannot provide a satisfactory description of this change. Spontaneous change is best described in terms of the discipline of Irreversible Thermodynamics, which addresses the rate of generation of total entropy of the system plus surroundings. The framework of Irreversible Thermodynamics will be established in terms of coupled fluxes and Onsager’s Reciprocity Principle and these concepts will be employed to explain thermal diffusion and electro-osmosis, among other phenomena.

MATSE 506 Interfacial Electrochemical Processes (3) Survey of thermodynamic and kinetic fundamentals of electrochemical processes at interfaces.

MATSE 506 Interfacial Electrochemical Processes (3)

This course will introduce students to the thermodynamic and kinetic fundamentals of interfacial electrochemical processes, with emphasis on the atomic/molecular level. The course will begin with a review of relevant concepts from electrochemical thermodynamics and charge transfer theory and will progress to the application of these fundamental concepts to describe reaction mechanisms, mass transfer, and other important phenomena, such as passivity and passivity breakdown. These processes will be described analytically, by solving the appropriate equations subject to the relevant natural laws (e.g., conservation of mass and charge and Faraday’s Law). The course will also emphasize the flexibility of analyzing electrochemical phenomena in different spaces, including temporal space and Laplace and Fourier frequency spaces, and will show how it is possible to transform between these various spaces to provide the most advantageous medium for mechanistic analysis. The mechanisms of actual charge transfer reactions will be analyzed, including the hydrogen electrode reaction and the oxygen electrode reaction to illustrate important concepts in mechanistic analysis, including the existence of adsorbed intermediates and pseudo-capacitance, the inhomogeneity of surface adsorption sites, surface structure, and quantum mechanical aspects of charge transfer (“partial” charge transfer). No prerequisites are specified, because the course begins with the very basics of electrochemistry. Furthermore, all of the students who would take this course have a background in materials science and engineering, chemistry, physics, mechanical engineering, chemical engineering, or engineering science and mechanics. Specification of prerequisites would only discourage enrollment. This course (with a 597 designation) has been taught several times in the past and no problems with the lack of prerequisites have been experienced.

MATSE 507 (BIOE 517) Biomaterials Surface Science (3) Special properties of surfaces as an important causative and
mediating agent in the biological response to materials.

MATSE 507 (BIOE 517) Biomaterials Surface Science (3)

This course will factor the classical picture of the biological response to materials into spatial and temporal components, identifying the special properties of surfaces as an important causative and mediating agent. Emphasis will be on biophysical mechanisms, the biological response to materials. Contact activation of blood plasma coagulation cascade, bioadhesion, and protein adsorption will be repeatedly used as example biological responses to material surfaces to illustrate concepts and principles. Leading theories attempting to correlate both kinds of intensity of biological responses to surface and interfacial energetics will be compared and contrasted through a process that will quantify important surface thermodynamic properties of materials. The hydrophobic effect and related phenomena, especially as this pertains to water solvent effects in biology, will receive special emphasis. A general background in chemistry and/or biology is required, but prerequisites are purposefully limited, reflecting the interdisciplinary aspects of the subject and to draw students from different specializations.

MATSE 512 (GEOSC 512) Principles of Crystal Chemistry (3) Relation of structure to ionic size and nature; influence of pressure and temperature on structure; chemical-structural defects, crystalline solutions, phase-transitions.

Crystal chemistry is concerned with the systematics of crystal structures as determined by ionic sizes and characteristics of chemical bonds and with changes in crystal structure with variations in temperature and pressure. The course begins with a short review of crystallography. It then proceeds to elements and ions as the building blocks of crystals. Models for the chemical bonds which bind elements and ions into crystals include classical electrostatic theory, crystal field theory, molecular orbital theory, and band theory. The principles underlying each model are explained. The next step in the buildup of crystals is to explain the principles of ionic packing, crystal defects, and the concepts of polymorphism and phase transitions.

With the underlying principles and theory in place, the second half of the course deals with a systematic presentation of the various families of crystal structures, their properties, and some indication of the practical utilization of the various structural families. The discussion proceeds from binary packing structures to packing structures of ternary and quaternary composition, to metal structures, to silicate structures, to organic crystals, to defect structures and non-crystalline solids.

The course is divided into seven parts, and grading is achieved by a 30-minute quiz following completion of each part. There is no suitable textbook, but a comprehensive set of printed notes is provided as are recommended readings of selected review articles and current literature. Students are also required to prepare a semester paper on a topic of their choice.

MATSE 514 Characterization of Materials (3) Classical and new (microprobe, scanning microscope, magnetic resonance, and Mossbauer) techniques for the characterization of composition, structure, defects, and surfaces.

MATSE 514 Characterization of Materials (3)

This course is designed for graduate and selected undergraduate students. The broad spectrum of the various materials characterization techniques will be briefly surveyed. Students will not be taught how to run specific instruments or be expected to be an expert on the analytical techniques. However, students will be given assignments that require a search of the literature and having discussions with the relevant experts to develop a detailed understanding of specific
characterization techniques. Students will also be required to apply statistical methods in their assigned projects.

The objectives of the course include the presentation of a survey of material characterization techniques, lectures on experimental design and use of statistical techniques, as well as problem-solving techniques. The goal is to provide students with a foundation in the use of characterization techniques to solve and diagnose material problems that can be identified and potentially resolved with materials characterization.

The first part of the lectures provides a survey on many of the material characterization techniques. The second part of the course covers statistical analysis of experimental data including small population statistics, error analysis, curve fitting routines, and a brief survey of statistical experimental design. The third part of the course covers problem-solving techniques using materials characterization. Several characterization problems are given to the class that require the formation of project teams composed of 4 to 5 class members to resolve. Each project team prepares oral and written reports for the problem selected.

MATSE 518 Wetting Properties of Materials: Theory and Practice (3) Fundamentals of water wetting phenomenon are developed with special emphasis on thermodynamics of absorption and adhesion.

MATSE 518 Wetting Properties of Materials: Theory and Practice (3)
This course will be of interest to students of applied surface science, especially those requiring an understanding of intermolecular forces in wetting phenomenon. A history-of-science approach is used to develop modern theory of contact angle and wetting; starting with the capillary theory of Laplace, through Gibbs and Guggenheim constructions of the interface, and ending with surface engineering of material wetting properties. General concepts are emphasized at the expense of mathematical detail and strengths/limitations of modern wetting theory are emphasized from a practical perspective, supplemented with hands-on laboratory experience. Adsorption and surfactancy are given special consideration along with the role that water structure and reactivity plays in controlling these phenomena. This course interfaces with curriculum in all branches of engineering and materials science, especially Bioengineering, Civil Engineering, and Materials Science and Engineering where consideration of the interaction of materials with aqueous solutions is of importance. Course materials are drawn from the primary literature, requiring students to consume reading from diverse sources and discuss scientific details in an interactive-classroom setting. Student evaluation will be based on class participation, homework assignments, and a term paper closely related to individual research interest. Access to web-based lecture notes is required.

MATSE 530 X-Ray Crystallography and Diffraction (3) Reciprocal lattices and the Ewald sphere construction; crystal structure determination by powder and single crystal techniques; space groups.

MATSE 530 X-Ray Crystallography and Diffraction (3)
MATSE 530 is a general introduction to the crystallography and x-ray diffraction for a variety of different studies of the structure of solids. Students will gain an understanding of basic crystallography, the geometry of diffraction measurements and instrumentation, and the interpretation of diffraction data. Diffraction studies using synchrotron radiation and neutrons are also discussed.

General Education: None
Diversity: None
MATSE 531 Transmission Electron Microscopy (3)
This course will present the fundamentals of elastic and inelastic electron beam interactions with solid-state materials. Students will learn theoretical and practical aspects of electron diffraction and imaging, energy-dispersive x-ray spectroscopy, and electron energy loss spectroscopy. They will learn how to apply this knowledge to conduct experiments in and interpret data from the transmission electron microscope.

MATSE 535 Geometrical Crystallography (3)
Visual, mathematical, and group theory approaches are used to examine in detail the geometry of periodic, quasiperiodic, and incommensurate structures. From computer-assisted class discussions and weekly homework assignments, the student becomes familiar with the symmetry operations involved in translation, rotation, and color changes. Point groups, space groups, and color groups are derived through a combination of visual and mathematical considerations. The structure of group theory is then explored and applied to the derivation of space groups.

MATSE 540 Crystal Anisotropy (3)
In this course symmetry and tensors are used to describe the physical properties of materials as a function of direction, i.e., how a material will respond to different types of stimuli as a function of direction. A variety of thermal, mechanical, electric, magnetic, and optical properties are covered, including pyroelectricity, pyromagnetism, thermal expansion, dielectric constant, magnetic susceptibility, piezoelectricity, piezomagnetism, elastic stiffness and compliance, electrostriction, magnetostriction, index of refraction, and non-linear optical effects. At first the response of single crystals are considered, but this is later extended to polycrystalline samples with various types of texture.

As the course makes extensive use of symmetry, several weeks are dedicated to the development of the 32 crystallographic point groups using group theory. Symmetry operations are described using coordinate transformation matrices and stereographic projections. Both tensor quantities and tensor properties are described as a function of increasing tensor rank (up to fourth rank) for a multitude of polar tensors followed by axial tensors. For magnetic materials, the 90 magnetic point groups are introduced. For polycrystalline materials, the 7 Curie groups are utilized. A variety of practical examples illustrating the use of tensors to describe the properties of materials are covered in class and in depth homework sets involving both matrix and tensor form. The computer program Mathematica is used extensively in class and in the homework sets to visualize the physical properties of materials in three dimensions as well as to rapidly apply symmetry and tensor methods to high-rank tensor properties of low symmetry materials.

MATSE 542 Polymeric Materials: The Solid State (3)
Introduction to the fundamental concepts necessary to understand solid state structure and properties of polymer materials.
This course will cover concepts important to understanding polymer solids and their physical properties. We will begin with the concept of (partial) crystallinity, and the solid state microstructure of semi-crystalline polymers and copolymers. The fundamentals of crystallization kinetics of polymers will be covered, as will the concept of ‘annealing’. Wide-angle x-ray diffraction and small-angle x-ray scattering methods will be discussed in the context of characterization of crystalline polymer structure. A discussion of nanoscale associations in both crystalline and non-crystalline ion-containing polymers will complete the first portion of the course. Several classes on the liquid crystalline state will follow, together with discussion of lyotropic and thermotropic liquid crystalline polymers. The fundamentals of binary and ternary polymer mixtures will come next. Concepts important to both miscible blends (e.g. concentration fluctuations) and immiscible blends (e.g. rubber toughening) will be covered. The origin of the morphology (phase diagrams) and properties of di-, tri- and multiblock copolymers will be discussed, as will their role as interfacial agents in multiphase systems. The latter portion of the course will be concerned with electrical and mechanical properties. The former will focus on dielectric relaxation, and conductivity (both electronic and ionic). The latter will focus on the relationship between solid state structure and mechanical (including viscoelastic) properties.

MATSE 543 (CHEM 543) Polymer Chemistry (3) This graduate course discusses recent advances in polymer chemistry that leads to new polymeric materials with interesting structures and properties.

MATSE (CHEM) 543 Polymer Chemistry (3)

This course provides advance level of polymer chemistry and materials taught in MATSE 441 - Polymeric Materials. Students are able to know the versatility that is inherent in polymer chemistry and the new research results and activities, especially controlling polymerization, polymer structures, designing polymers with desirable properties, etc. Students shall also understand the major economic and environmental concerns and solutions in producing commercial-scale polymers.

This polymer chemistry course provides important links between chemistry and polymeric materials. The course will focus on recent advances in polymer chemistry that affords new polymer materials with controlled polymer structures, compositions, and properties, as well as economic and “green” processes.

This course is designed for graduate students having basic knowledge in organic, inorganic, and organometallic principles. For Chemistry major, this course offers students with the knowledge to apply chemical principles and methods to design and prepare the desirable polymers (no prerequisite for Chemistry graduate students). For Material Science and other majors, this course provides advance level of polymer chemistry and materials taught in MATSE 441 (a prerequisite course).

In addition, each student will be required to review (presentation and term-paper) a contemporary subject relative to polymer chemistry, which will help student self-education, and presentation and writing skills. Students will be evaluated by quizzes and examinations, a term-paper and presentation, and class participation.

MATSE 561 Metal Electrode Reactions (2-3) Evaluation of electrode reaction mechanisms and kinetics at metal/electrolyte interfaces relevant to corrosion and industrial electrolyte processes.

MATSE 561 Metal Electrode Reactions (2-3)

This variable 2- or 3-credit course lays out the fundamental principles of electrode reactions that occur during corrosive degradation of metals and in various important commercial electrolytic processes, such as electroplating, electroless plating, battery and fuel cell operation, aqueous extractive metallurgy, and corrosion prevention techniques. An introductory background in electrochemistry is assumed, such as would be obtained from an introductory electrochemistry or corrosion course, e.g., MATSE 421. The objectives of this course are to introduce the student to some advanced aspects of the (1) thermodynamic and kinetic bases of electrode reactions, (2) nature of commercial electroplating, etching, polishing and degradation of corrosion resistant alloys, and (3) principles of current distribution on planar surfaces and their extension to recesses and protrusions at surfaces such as are encountered in localized corrosion and electropolishing of rough metal surfaces, respectively. Goal 3 emphasizes the important roles of polarization and IR voltage in determining the distributions of the electrode potential and metal dissolution and plating rates inside crevices, pits, cracks, etc.

Exams and written and oral reports are used in evaluation of performance.

This course would be of interest to engineering and science graduate students wanting to be technologically informed about the nature of commercial electrolytic processes and/or desiring to enter into basic or applied research of these processes.

This is a Spring Semester offering in the Department of Materials Science and Engineering.

The 3-credit version includes an independent student investigation of an electrochemistry-related topic, preparation of a written proposal for obtaining funding for investigative research into some aspect of the topic, and an oral summary of the proposal.

MATSE 562 Solid to Solid Phase Transformations (3) Mechanisms and rate-determining factors in solid-phase reactions in
MATSE 563 Solid to Solid Phase Transformations (3)

This is the fundamental science of microstructural control in the solid state for inorganic materials. The course begins with a review of the crystallography of solid materials, from the simple concept of a lattice through the description of the stereographic projection to the point group notation.

Solid to solid nucleation theory is examined in detail as it forms the basis of microstructural development and control. Both "civilian" and "military" transformations are considered.

The phenomena of nucleation, growth, and coarsening are all modified, and/or even controlled, by defects such as dislocations and grain boundaries. The course reviews dislocation theory and, e.g., the O-lattice description of high angle grain boundaries and interphase interfaces.

A series of prototypical phase transformations are described in detail. These include: homogeneous and heterogeneous precipitation reactions; spinodal decomposition; order-disorder transformations, discontinuous precipitation, the eutectoid reaction, bainite and martensite.

Finally, experimental methods for the quantitative characterization of microstructure are presented.

MATSE 565 (E MCH 534) Micromechanisms of Fracture (3) Mechanisms of fracture and their relationship to loading conditions, environment, flow behavior, processing history, and microstructure.

MATSE 565 (E MCH 534) Micromechanisms of Fracture (3)

The in-service performance of structural materials relies on a combination of the mechanics of loading and of the material's ability to avoid fracture. Thus, modern mechanical design requires knowledge of fracture processes and fracture-based design criteria. This course addresses the mechanisms that control the fracture of structural materials. For the purposes of this course, structural materials are separated into two groups; "monolithic" materials (primarily polymers, metals, and alloys) and composite materials. An understanding of fracture mechanisms can serve as a basis for predicting failure conditions, performing failure analyses, or simply for recognizing when existing failure predictions may be wrong (i.e., "how to avoid bad surprises").

MATSE 566 (E MCH 535) Deformation Mechanisms in Materials (3) Deformation of crystalline/amorphous solids and relationship to structure; elastic, viscoelastic and plastic response over a range of temperatures and strain rates.

MATSE 566 (E MCH 535) Deformation Mechanisms in Materials (3)

The course will study the relationship between the deformation mechanisms in materials and their structure. The types of deformation behavior considered in the course are linear elasticity (isotropic or anisotropic), viscoelasticity and plastic deformation. For the elastic behavior, the emphasis will be on the way elastic behavior is controlled by atomic structure and microstructure. The constitutive laws that describe this behavior and the assumptions on which they are based will be introduced. The next phase of the course considers the range of deformation behavior from purely viscous (linear or non-linear) to viscoelastic. Initially, the emphasis will be on the effects of temperature and strain history and the way this behavior is described by mechanical analogs. The effect of structure on creep and stress relaxation will be described. The use of linear viscoelasticity in describing the sintering process will also be included. In ductile crystalline materials, deformation is associated with the movement of dislocations. The types of dislocations, their stress fields and energies will be described. These aspects will then be combined with structural features by including considerations of slip geometry and obstacles to dislocation motion. This approach will allow strengthening methods to be identified and quantified. Finally, creep mechanisms in crystalline materials at high temperature will be discussed and quantified.

MATSE 565 Metals in Electronics (3) Processing and performance of metals in electronics, covering electrical resistivity, metal film deposition, metal/semiconductor contacts, interconnects, and electronic packaging.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATSE 565 Metals in Electronics (3)

This course addresses the processing, use, and performance of metals in electronics. The course is intended to provide students with a background in semiconducting or other electronic materials with specific knowledge about the application of metals in electronics as well as to allow students with a metallurgical background to learn about how their expertise fits into the electronics industry. Topics covered include electrical resistivity in thin metal and alloy films, deposition of thin metal films, metal/semiconductor contacts, interconnects in microelectronics, electromigration, diffusion barriers, electronic packaging, and metal/metal contacts. Grades are based on homework problems, a term paper, and class presentations. The course is offered in alternate fall semesters.

MATSE 570 (EME 570) Catalytic Materials (3) Preparation and characterization of solid catalytic materials and the relationships between their surface, defect, and electronic properties and catalytic activity.

MATSE (EME) 570 Catalytic Materials (3)

This course covers the preparation and characterization of solid catalytic materials, and the relationships between the surface and electronic properties and pore structure of the materials and their catalytic activity and selectivity. The course includes the following materials: zeolites and molecular sieves; metals and alloys; metal oxides; metal sulfides; and other catalytic materials. Also included are the major applications of catalytic materials in chemical and petroleum industries and in other manufacturing industries for environmental protection. This course can be grouped into three parts: (1) introduction to catalysis and analytical techniques; (2) synthesis and characterization of catalytic materials; and (3) catalysis at surfaces of solid materials. The course is suitable for a broad spectrum of students in energy and mineral engineering, materials science and engineering, fuel science, chemical engineering, chemistry, solid-state science, and environmental engineering.

Effective: Fall 2008
Prerequisite:

MATSE 575 Functional Polymeric Materials (3) In-depth discussions of structure/property relationships in functional polymers and modern concepts of polymerization methods.

MATSE 575 Polymeric Materials I (3)

This 3-credit course focuses on the advances in polymer chemistry and new polymer materials that show unique physical properties (including mechanical, solution, optical, and electric). The discussion updates the progresses in the past 10 years along three polymerization mechanisms--step, chain, and ring opening with their kinetic and thermodynamic features, as well as new chemical reactions on the preformed polymers. The scope and limitations of each reaction and the process conditions which can be used to carry them out in small-and large-scale productions are discussed in detail. Each student is also required to involve self-study in an assigned subject and present the findings in the class and/or term paper.

MATSE 580 Computational Thermodynamics (3) The integration of fundamental principles and advanced computational approaches in the thermodynamics of materials, including hands-on computation, theory and application.

Computational Thermodynamics (3)
MATSE 581 Computational Materials Science II: Continuum, Mesocale Simulations (3)

This course will focus on computational techniques and fundamentals of phase transformation simulations on the continuum, mesocale level. The objective of the course is to introduce the evolution of simulation techniques and integrate fundamental principles in thermodynamics and kinetics with advanced computational approaches.

The teaching will be problem-oriented using literature publications. There will be many hands-on computer exercises to gain experience in presenting problems to computer and interpreting the computer results. This course is particularly useful for students who would like to explore the power of computational approaches and would like to understand the thermodynamic and kinetic principles behind computational phase transformations.

MATSE 582 Materials Science and Engineering Professional Development (1)

This course covers ethical conduct of research, pathways of professional development and strategies and tools for research.

MATSE 590 Colloquium (1-3)

Continuing seminars which consist of a series of individual lectures by faculty, students, or outside speakers.

MATSE 596 Individual Studies (1-9)

Creative projects, including nonthesis research, which are supervised on an individual basis and which fall outside the scope of formal courses.

MATSE 597 Special Topics (1-9)

Formal courses given on a topical or special interest subject which may be offered infrequently.
MATSE 597B (EGEE 597B) Nanoscale Energy and Environmental Engineering (3) The course will cover the synthesis, characterization and applications of nanomaterials to energy generation, storage, conversion, conservation, control and environmental engineering. Selected topics in nanomaterial toxicity and production/process/product economics will be included.

Nanoscale Energy and Environmental Engineering (3)

MATSE 598 Special Topics (1-9) Formal courses given on a topical or special interest subject which may be offered infrequently.

MATH 403H Honors Classical Analysis I (3) Development of a thorough understanding and technical mastery of foundations of classical analysis in the framework of metric spaces.

MATH 403H Honors Classical Analysis I (3)
The central aim of this course is to develop thorough understanding and technical mastery of foundations of classical analysis in the framework of metric spaces rather than multidimensional Euclidean spaces. This level of abstraction is essential since it is in the background of functional analysis, a fundamental tool for modern mathematics and physics. Another motivation for studying analysis in this wider context is that many general results about functions of one or several real variables are more easily grasped at this more abstract level, and, besides, the same methods and techniques are applicable to a wider class of problems, e.g. to the study of function spaces. This approach also brings to high relief some of the fundamental connections between analysis on one hand and (higher) algebra and geometry on the other.

This course is a sequel to Math 312H; it is highly recommended to all mathematics, physics and natural sciences majors who are graduate school bound, and is a great opportunity for all Schreyer Scholars.

The following topics will be covered: Metric spaces (topology, convergence, Cauchy sequences and completeness); Maps between metric spaces (continuous maps and homeomorphisms, stronger continuity properties; uniform continuity, Holder and Lipschitz continuity, contraction mapping principle, points of discontinuity and the Baire Category Theorem); Compact metric spaces (continuity and compactness, connectedness, total boundedness, coverings
and Lebesgue number, perfect metric spaces, characterization of Cantor sets, fractals); Function spaces (spaces of continuous maps, uniform continuity and equicontinuity, Arzela-Ascoli Theorem, uniform approximation by polynomials. Stone-Weierstrass Theorem).

MATH 410 Complex Analysis for Mathematics and Engineering (3) Complex analytic functions; Cauchy-Riemann equations; complex contour integrals; Cauchy's integral formula; Taylor and Laurent series; residue theory; applications in engineering.

MATH 410 Complex Analysis for Mathematics and Engineering (3)

A succinct stand-alone course description (up to 400 words) to be made available to students through the on-line Bulletin and Schedule of Courses.

This is a complex analysis course designed for students in mathematics, applied mathematics, engineering, science, and related fields. Topics include complex numbers; analytic functions, complex differentiability, and the Cauchy-Riemann...
This course focuses on the definitions, concepts, calculation techniques, supporting theory, and examples of applications suited to the usage of complex analysis in mathematics, applied mathematics, science, and engineering.

Students who have passed MATH 406 or MATH 421 may not take this course for credit.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 411 Ordinary Differential Equations (3)**

Linear ordinary differential equations; existence and uniqueness questions; series solutions; special functions; eigenvalue problems; Laplace transforms; additional topics and applications.

**MATH 412 Fourier Series and Partial Differential Equations (3)**

Orthogonal systems and Fourier series; derivation and classification of partial differential equations; eigenvalue function method and its applications; additional topics.

(BA) This course meets the Bachelor of Arts degree requirements.

The purpose of MATH 412 is to introduce students to the origins, theory, and applications of partial differential equations. Several basic physical phenomena are considered - including flows, vibrations, and diffusions - and used to derive the relevant equations. The fundamentals of the mathematical theory of partial differential equations are motivated and developed for the students through the systematic exploration of these classic physical systems and their corresponding equations: the Laplace, wave, and heat equations.

In addition to treating the physical origins of the equations, this course focuses on solving evolution equations as initial value problems on unbounded domains (the Cauchy problem), and also on solving partial differential equations on bounded domains (boundary value problems). There is not one but many techniques for solving these equations, and the course presents some aspect of the expansion in orthogonal functions (including Fourier series), eigenvalue theory, functional analysis, and the use of separation of variables, Fourier transforms, and Laplace transforms to solve PDEs by converting them to ordinary differential equations.

This course currently serves a cross-section of students at the university with interests or the need for this advanced subject mathematics, including students majoring in the engineering program, meteorology, physics, and mathematics. This typically includes the most advanced physics, engineering, and meteorology students, as well as mathematics majors with interests in applied mathematics.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 414 (STAT 414) Introduction to Probability Theory (3)**

Probability spaces, discrete and continuous random variables, transformations, expectations, generating functions, conditional distributions, law of large numbers, central limit theorems. Students may take only one course from MATH(STAT) 414 and 418 for credit.

**Introduction to Probability Theory (3)**

MATH 417 Qualitative Theory of Differential Equations (3)

(BA) This course meets the Bachelor of Arts degree requirements.

The main objective of the course is the qualitative theory of ordinary differential equations such as existence and uniqueness of solutions, dependence on initial data and parameters, and basic stability of solutions for both linear and nonlinear equations. It is designed to introduce students to modern concepts including the bifurcation theory, intermittent (transitional) and chaotic behavior of solutions and dynamical system approach to differential equations. Along the way, a number of applications are discussed and students get familiar with some basic examples illustrating main principles of the theory, such as Lorenz attractor, predator-prey models, etc.

The course is completed by students majoring in engineering programs, the sciences, and mathematics.

MATH 418 (STAT 418) Introduction to Probability and Stochastic Processes for Engineering (3) Introduction to probability axioms, combinatorics, random variables, limit laws, and stochastic processes. Students may take only one course from MATH(STAT) 414 and 418 for credit.

MATH (STAT) 418 Introduction to Probability and Stochastic Processing for Engineering (3)

This course gives an introduction to probability and random processes. The topics are not covered as deeply as in a semester-long course in probability only or in a semester-long course in stochastic processes only. It is intended as a service course primarily for engineering students, though no engineering background is required or assumed. The topics covered include probability axioms, conditional probability, and combinatorics; discrete random variables; random variables with continuous distributions; jointly distributed random variables and random vectors; sums of random variables and moment generating functions; and stochastic processes, including Poisson, Brownian motion, and Gaussian processes.

**MATH 422 Wavelets and Fourier Analysis: Theory and Applications (3)** Fundamental mathematical issues of the theory of wavelets for senior undergraduate and graduate students in mathematics, engineering, physics, and computer science.

Numerous problems arising in science and engineering find a common mathematical language in the theory of wavelets. Wavelet analysis can be viewed as an alternative as well as a generalization of classical Fourier analysis. In the latter case, the goal is to measure the local frequency content of a signal, while in the case of wavelets one is comparing several magnifications of this sequence with distinct resolutions. The goal of wavelets in mathematics engineering and science may be illustrated with the following archetypical problem. Suppose that we are given a real valued function of one variable representing some real-life phenomenon. For instance the function may represent a voice signal that we wish to transmit over the telephone lines or store in a compact disk. The whole function is given by the totality of its values and this makes it a continuum set of points. Both Fourier and wavelet analyses deal with discretizing the information and possibly extracting from it an appropriate finite sample. The difference between both types of approaches can be illustrated by the method of construction of the corresponding building blocks. In Fourier analysis, this process involves multiplications of a fixed "window function" by sines and cosines. In the case of wavelets, the window function is no longer multiplied by trigonometric functions, but instead it is translated and dilated by arbitrary translations and dilations.

The subject of wavelets appeared in the mid 1980's influenced by ideas from both pure mathematics (harmonic analysis, functional analysis, approximation theory, fractal sets) and applied mathematics (signal and image processing, mathematical physics, numerical analysis).

The purpose of the course is to show how wavelets can be constructed, illustrate why they provide us with a particularly powerful tool in mathematical analysis, and indicate how they can be used in applications.

The course is open to a wide range of undergraduate as well as graduate students with majors in mathematics, science, engineering and computer science. The course is accessible to students with some basic knowledge of the Fourier transform and its applications.

Main topics include:
1) the wavelet transform;  
2) orthogonal wavelet decomposition;  
3) applications to data compression, numerical analysis, image processing.

**MATH 437 Algebraic Geometry (3)**

Study of curves in the plane defined by polynomial equations \( p(x,y) = 0 \). Projective equivalence, singular points, classification of cubics.

( BA ) This course meets the Bachelor of Arts degree requirements.

The geometric study of algebraic equations is one of the oldest and deepest parts of mathematics, and it lies at the heart of modern developments in geometry, algebra, number theory and physics. Students completing MATH 437 will understand many new algebraic and geometric ideas by studying examples of curves defined by equations of degrees 2 and 3 in the plane.

First come conics (given by equations of degree 2 in two variables). Rigid motions, similarities, and affine transformations give different classifications of them. New ideas then show how to get a conic through any five points and prove Pascal's theorem about six points on a conic. Special cases suggest extension of the usual plane to the projective plane, with "points at infinity," homogeneous coordinates, and projective transformations.

The main part of the course turns to equations of degree 3 and their singularities, flex points, tangents, and degeneracies. Several new ideas, both algebraic and analytic, are brought in to prove the existence of complex flex points on singular cubics and then real flex points on nonsingular real cubics. There is then a classification on complex projective cubics by a single parameter and finally a full classification of all real projective cubics.

As time permits, relations to further topics are sketched: addition of points on a nonsingular cubic, Mordell's theorem, doubly periodic functions, and Fermat's last theorem.

The course is typically taken by mathematics majors.

The Pennsylvania State University
Many phenomena that arise in the natural sciences, such as the motion of pendulum or signal conduction in neurons or oscillations in certain chemical reactions, can be modeled using nonlinear differential equations. This course will develop the mathematical techniques needed to investigate such differential equations. These techniques include the study of equilibria, stability, phase plane analysis, bifurcation analysis and chaos. The course will assume prior knowledge of ordinary differential equations at the MATH 250/251 level; this is the only prerequisite for the course. We will focus on understanding and interpreting the behavior of the solutions to the differential equation models rather than on deriving the model equations themselves. Evaluation will be based on midterm exams, a final exam, graded homework, and graded longer projects which may involve computer work. The course should be of interest to any science or engineering major and some models will be chosen to reflect the fields of interest of the class. The goal is for the students to be able to apply the techniques learned in the course to mathematical models that they will encounter in other classes or situations. The class will be offered every other year with an expected enrollment of 10-15 students.

MATH 450 Mathematical Modeling (3) Constructing mathematical models of physical phenomena; topics include pendulum motion, polymer fluids, chemical reactions, waves, flight, and chaos.

MATH 450 Mathematical Modeling (3)
The purpose of the course is to introduce mathematical modeling, i.e., the construction of mathematical structures which capture relevant physical phenomena. The course will systematically explore mathematical ideas and tools used to study the natural world. Particular emphasis will be placed on the process of creating a mathematical model starting from a physical scenario. Typically this process will begin with an experiment either demonstrated in the W. G. Pritchard Lab or performed by the students in class.

Once a particular model has been developed, students will use mathematical analysis and experimentation to determine the properties and relevance of the model, and to make predictions. Often the model can be satisfactory; however, many times one also finds new features of the system that are not adequately accounted for in the model, and the process begins again. It is this cycle the course will focus on. For a given phenomenon (e.g., flow of viscous fluid, pendulum motion) several models may be compared and contrasted, and possible simplifications will be discussed.

A significant aspect of the course is its laboratory component, in which the students will perform experiments or observe demonstrations. However, the main emphasis will be placed on creating and rigorously analyzing the mathematical aspects of the models. Instead of presenting a finely tuned model for a given phenomenon, this course will try to convey some of the heuristic, intuitive, and mathematical ideas employed in modeling.

Examples of physical systems to be considered include: simple and compound pendulum motion, chemical oscillations, water waves, and elastic behavior of polymer solutions.

The course is open to a wide range of undergraduate as well as graduate students with majors in mathematics, biology, chemistry, engineering, and physics. The course should be accessible to students with some basic knowledge of mathematical analysis and differential equations. Main topics include: modeling with ordinary differential equations; bifurcation theory and stability; traveling waves in epidemics, chemical reactions, free fluid surfaces, and polymer solutions; fluctuations in nature, stochastic differential equations and chaos.

**MATH 465 Number Theory (3)**

(BA) This course meets the Bachelor of Arts degree requirements.

This course serves as an upper-level introduction to the fundamentals of elementary number theory. A major emphasis in the course is placed on the role that the prime numbers play in the study of properties of the integers along with the related topics of divisibility and factorization of integers. Additional topics covered in the course include congruences (and the theorems of Euler and Fermat which are classics in this area), properties of arithmetic functions including those which are multiplicative, and other topics such as Pythagorean triples and representations of numbers as sums of squares.

This course is completed by a wide variety of students across the university, especially those majoring in mathematics. (In many of the options in the MTHBS degree, MATH 465 can be used to satisfy one of the major requirements.) The course is also taken quite frequently by non-mathematics majors who wish to use the course to satisfy an upper-level requirement for the mathematics minor.

**MATH 475W** (US;IL) History of Mathematics (3) A global survey of the history of mathematics as viewed as a human response to cultural, political, economic, and societal pressures.

**History of Mathematics (3)**

The primary goal of this course is to explore where mathematics comes from, how it was labored on, how ideas were perceived, and how theories developed. Development in algebra, geometry, arithmetic and calculus will be discussed.

A second goal is to help students understand the importance of written communication in mathematics and to provide opportunities for students to improve the quality of their writing. The primary means for accomplishing this goal will be four papers, 4-8 pages in length. These will be written for an audience of mathematically-knowledgeable readers. In addition, each quiz will contain at least one essay question.

Students will be evaluated on quizzes, homework, papers, and a final exam. Quizzes will total 250 points, the papers 200 points, and the final exam 150 points.

This course is a required course in the Mathematical Science (MA SC) BS curriculum. This course is also available as an elective for students in the Computer Science (COMP) program.

The Pennsylvania State University
No special facilities are required for this course. This course will be offered once per year, with an expected enrollment of 25-40 students.

MATH 479 (PHYS 479) Special and General Relativity (3) Mathematical description, physical concepts, and experimental tests of special and general relativity.

MATH (PHYS) 479 Special and General Relativity (3)
This course is intended as an elective course (within the undergraduate Physics program) for Physics majors to be taken in their senior year. Intended to be cross-listed with MATH, it can also be used in support of a Mathematics minor and, in some options, within the Math program as a program elective as well. The course significantly expands upon the introduction to Special Relativity (SR) seen in PHYS 237, including discussions of experimental tests of SR and applications to relativistic mechanics. It then introduces students to the mathematical machinery required to understand General Relativity (GR), starting with the description of curved spacetimes and geodesics. It discusses solutions to the Einstein equations and surveys the classic tests which established the validity of General Relativity. It concludes with applications of GR in such areas as black hole physics, the generation and detection of gravitational waves, other topics (such as cosmology, relativistic astrophysics, etc.).

MATH 486 Mathematical Theory of Games (3) Basic theorems, concepts, and methods in the mathematical study of games of strategy; determination of optimal play when possible.

This course covers several major classes of models and methods for analyzing multi-party strategic interactions, i.e. games. Specific topics include extensive and strategic form games, continuous games, cooperative games, strictly competitive games, repeated games and adaptive learning, and evolutionary models. The effects on outcomes of information, communication, and other modeling assumptions are discussed. Real-world examples drawn from economics, biology, anthropology, management and everyday life are discussed in detail. When appropriate, computer algebra systems are incorporated in the course. The course typically meets during either two 75-minute periods each week or three 50-minute periods each week. Evaluation methods may vary by instructor, but will typically include a combination of examinations, quizzes, homework, and projects.

MATH 499 (IL) Foreign Studies (1-12) Courses offered in foreign countries by individual or group instruction.

MATH 499A (IL) Geometry and Mathematical Physics (2) PSU-PKU International Undergraduate Summer School, 2014 in Beijing, China.

MATH 501 Real Analysis I (3)

This course develops Lebesgue measure and integration theory. This is a centerpiece of modern analysis, providing a key tool in many areas of pure and applied mathematics. The course covers the following topics: Lebesgue measure theory, measurable sets and measurable functions, Lebesgue integration, convergence theorems, Lp spaces, decomposition and differentiation of measures, convolutions, the Fourier transform.
MATH 502 Complex Analysis (3) Complex numbers, Holomorphic functions, Cauchy's theorem, Meromorphic functions, Laurent expansions, residue calculus, Conformal maps, topology of the plane.

MATH 502 Complex Analysis (3)

This course is devoted to the analysis of differentiable functions of a complex variable. This is a central topic in pure mathematics, as well as a vital computational tool. The course covers the following topics: complex numbers, holomorphic functions, Cauchy's theorem, meromorphic functions, Laurent expansions, residue calculus, conformal maps, topology of the plane.

Complex Analysis: Theory and Applications I (3)
MATH 523 Numerical Analysis I (3) Approximation and interpolation, numerical quadrature, direct methods of numerical linear algebra, numerical solutions of nonlinear systems and optimization.

1. Approximation and interpolation. Weierstrass theorem, Bernstein polynomials, Jackson theorems, Lagrange interpolation.
leat squares approximation, orthogonal polynomials, piecewise Lagrange and Hermite interpolation, spline interpolation, the Fast Fourier Transform.

3. Direct methods of numerical linear algebra. Gaussian elimination with pivoting, backward error analysis, conditioning of linear systems.

This course provides a graduate level foundation in numerical linear algebra. It covers the mathematical theory behind numerical algorithms for the solution of linear systems of equations and eigenvalue problems. Specific topics include: matrix decompositions, direct methods of numerical linear algebra, eigenvalue computations, iterative methods.

MATH 527 Metric and Topological Spaces (3) Metric spaces, continuous maps, compactness, connectedness, and completeness. Topological spaces, products, quotients, homotopy, fundamental group, simple applications.

This course covers the classical theory of metric and topological spaces. It provides the background for several other courses in analysis, as well as a foundation in methods of algebraic topology. This course starts by covering foundational material, so it is accessible to all first-year graduate students. The following topics are covered: metric spaces, continuous maps, compactness, connectedness, completeness, topological spaces, products, quotients, homotopy, fundamental group, and provide simple applications.
MATH 528 Differentiable Manifolds (3)

This course covers the foundations of differential geometry, developing the theory of differentiation and integration on manifolds. It provides tools for the study of nonlinear problems, combining techniques in analysis and geometry. Concepts and tools from differential geometry have found wide use in different areas of mathematics, including nonlinear differential equations, control and optimization problems, and numerical analysis. The goal is to cover the most important techniques of differential geometry in a concise way. The course will appeal not only to students who plan to do research in geometry, but also to those interested in analysis, or applied and computational mathematics, as well. It covers the following topics: smooth manifolds, smooth maps, Sard’s theorem, the tangent bundle, vector fields, differential forms, integration on manifolds, foliations, de Rham cohomology, Lie groups, smooth actions, quotient spaces, examples.

General Education: None
Diversity: None

MATH 534 Lie Theory II (3) Representations of compact Lie groups and semisimple Lie algebras, characters, orthogonality, Peter-Weyl theorem, Cartan-Weyl highest weight theory.
Lie Theory II (3)

General Education: None  
Diversity: None  
Bachelor of Arts: None  
Effective: Spring 1992  
Prerequisite:  

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 535 Linear Algebra (3)

This course reviews undergraduate linear algebra and proceeds to more advanced topics. Its purpose is to provide a solid understanding of linear algebra, which is needed throughout graduate mathematics. It covers the following topics: vector spaces, linear transformations, bilinear forms, canonical forms for linear transformations, multilinear algebra.

MATH 536 Abstract Algebra (3)

This course covers fundamental concepts, needed toward the study of advanced areas in abstract algebra. The course covers the following topics: groups, Sylow's theorems, rings, ideals, unique factorization domains, finitely generated modules, fields, algebraic and transcendental field extensions, Galois theory.

MATH 537 Field Theory (3) Finite and infinite algebraic extensions; cyclotomic fields; transcendental extensions; bases of transcendence, Luroth's theorem, ordered fields, valuations; formally real fields.

Field Theory (3)

MATH 538 Commutative Algebra (3) Topics selected from Noetherian rings and modules, primary decompositions, Dedekind domains and ideal theory, other special types of commutative rings or fields.

Commutative Algebra (3)
Group Theory I (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 1983
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 547 Algebraic Geometry I (3) Affine and projective algebraic varieties; Zariski topology; Hilbert Nullstellensatz; regular functions and maps; birationality; smooth varieties normalization; dimension.

Algebraic Geometry I (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 548 Algebraic Geometry II (3) Topics may include algebraic curves, Riemann-Roch theorem, linear systems and divisors, intersection theory, schemes, sheaf cohomology, algebraic groups.

Algebraic Geometry II (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 550 (CSE 550) Numerical Linear Algebra (3) Solution of linear systems, sparse matrix techniques, linear least squares, singular value decomposition, numerical computation of eigenvalues and eigenvectors.

Numerical Linear Algebra (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 551 (CSE 551) Numerical Solution of Ordinary Differential Equations (3) Methods for initial value and boundary value problems; convergence and stability analysis, automatic error control, stiff systems, boundary value problems.

Numerical Solution of Ordinary Differential Equations (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 552 (CSE 552) Numerical Solution of Partial Differential Equations (3) Finite difference methods for elliptic, parabolic, and hyperbolic differential equations; solutions techniques for discretized systems; finite element methods for elliptic problems.

Numerical Solution of Partial Differential Equations (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
MATH 553 (CSE 553) Introduction to Approximation Theory (3) Interpolation; remainder theory; approximation of functions; error analysis; orthogonal polynomials; approximation of linear functionals; functional analysis applied to numerical analysis.

Introduction to Approximation Theory (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 554 Approximation Theory (3) Approximation in normed spaces; existence, uniqueness, characterization, computation of best approximations; error bounds; degree of approximation; approximation of linear functionals.

Approximation Theory (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 555 (CSE 555) Numerical Optimization Techniques (3) unconstrained and constrained optimization methods, linear and quadratic programming, software issues, ellipsoid and Karmarkar's algorithm, global optimization, parallelism in optimization.

Numerical Optimization Techniques (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 556 (CSE 556) Finite Element Methods (3) Sobolev spaces, variational formulations of boundary value problems; piecewise polynomial approximation theory, convergence and stability, special methods and applications.

Finite Element Methods (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1996
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 557 Mathematical Logic (3) The predicate calculus; completeness and compactness; Godel's first and second incompleteness theorems; introduction to model theory; introduction to proof theory.

Mathematical Logic (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 558 Foundations of Mathematics I (3) Decidability of the real numbers; computability; undecidability of the natural numbers; models of set theory; axiom of choice; continuum hypothesis.

Foundations of Mathematics I (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 559 Recursion Theory I (3)** Recursive functions; degrees of unsolvability; hyperarithmetic theory; applications to Borel combinatorics. Computational complexity. Combinatory logic and the Lambda calculus.

**Recursion Theory I (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2011
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 561 Set Theory I (3)** Models of set theory. Inner models, forcing, large cardinals, determinacy. Descriptive set theory. Applications to analysis.

**Set Theory I (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 565 Foundations of Mathematics II (3)** Subsystems of second order arithmetic; set existence axioms; reverse mathematics; foundations of analysis and algebra.

**Foundations of Mathematics II (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1992
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 567 Number Theory I (3)** Congruences, quadratic residues, arithmetic functions, partitions, classical multiplicative ideal theory, valuations and p-adic numbers; primes in arithmetic progression, distribution of primes.

**Number Theory I (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1994
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 568 Number Theory II (3)** Congruences, quadratic residues, arithmetic functions, partitions, classical multiplicative ideal theory, valuations and p-adic numbers; primes in arithmetic progression, distribution of primes.

**Number Theory II (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1994
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 569 Algebraic Number Theory I (3)** Dedekind rings; cyclotomic and Kummer extensions; valuations; ramification, decomposition, inertial groups; Galois extensions; locally compact groups of number theory.

**Algebraic Number Theory I (3)**

General Education: None
MATH 570 Algebraic Number Theory II (3) Topics chosen from class field theory; integral quadratic forms; algebraic and arithmetic groups; algebraic function of one variable.

MATH 571 Analytic Number Theory I (3) Improvements of the prime number theorem, L-functions and class numbers, asymptotic and arithmetic properties of coefficients of modular forms.

MATH 572 Analytic Number Theory II (3) Distribution of primes, analytic number theory in algebraic number fields, transcendental numbers, advanced theory of partitions.

MATH 574 Topics in Logic and Foundations (3-6 per semester) Topics in mathematical logic and the foundations of mathematics.

MATH 577 (M E 577) Stochastic Systems for Science and Engineering (3) The course develops the theory of stochastic processes and linear and nonlinear stochastic differential equations for applications to science and engineering.

MATH 578 (M E 578) Theory & Applications of Wavelets (3) Theory and physical interpretation of continuous and discrete wavelet transforms for applications in different disciplines.
MATH 580 Introduction to Applied Mathematics I (3) A graduate course of fundamental techniques including tensor, ordinary and partial differential equations, and linear transforms.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 581 Introduction to Applied Mathematics II (3) A graduate course of fundamental techniques including Ordinary, Partial, and Stochastic Differential Equations, Wavelet Analysis, and Perturbation Theory.

MATH 581 Introduction to Applied Mathematics II (3)

Introduction to Applied Mathematics I (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2012
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 581 Introduction to Applied Mathematics II (3)

Introduction to Applied Mathematics II (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2003
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 582 Introduction to C* Algebra Theory (3) Basic properties of C* algebras, representation theory, group C* algebras and crossed products, tensor products, nuclearity and exactness.

Introduction to C* Algebra Theory (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2003
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Introduction to K-Theory (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2006
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 584 Introduction to von Neumann Algebras (3) Comparison of projections, traces, tensor products, ITPFI factors and crossed products, the Jones index, modular theory, free probability.

MATH 584 Introduction to von Neumann Algebras (3)

A concise introduction to von Neumann algebra theory, beginning with the basic definitions and proceeding through
modular theory. The currently important subjects of index theory and free probability theory will be introduced.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 585 Topics in Mathematical Modeling (3) Introduction to mathematical modeling, covering the basic modeling and common mathematical techniques for problems from physical, biological and social sciences.

MATH 585 Topics in Mathematical Modeling (3)

The course provides an introduction to the basic mathematical modeling process that includes a statement of the problem, formulation of a model, different types of a model, parameter identifications, mathematical analysis and numerical solution, model reduction and simplifications, uncertainty quantification, model validation and interpretation of findings. It also covers related mathematical techniques such as methods for dimensional analysis, analytical and numerical approximations, bifurcation analysis and perturbation theory, parameter identification and estimation techniques.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 588 (CSE 588) Complexity in Computer Algebra (3) Complexity of integer multiplication, polynomial multiplication, fast Fourier transform, division, calculating the greatest common divisor of polynomials.

Complexity in Computer Algebra (3)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 590 Colloquium (1-3) Continuing seminars which consist of a series of individual lectures by faculty, students, or outside speakers.

Colloquium (1-3)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 596 Individual Studies (1-9) Creative projects, including nonthesis research, which are supervised on an individual basis and which fall outside the scope of formal courses.

Individual Studies (1-9)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 597 Special Topics (1-9) Formal courses given on a topical or special interest subject which may be offered infrequently; several different topics may be taught in one year or term.

Special Topics (1-9)
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 597A Graduate Student Seminar (3)** Mathematics graduate students must complete the seminar before his or her third year of study. Each student participating in the seminar is expected to give a presentation. The topic may have no relation to the student's area of specialization. The topics should be "marvels of mathematics" requiring no special background and be selected across all areas of mathematics in wide consultation with the faculty.

**Graduate Student Seminar (3)**

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 597B Bounded Gaps Between Prime Numbers (3)** In the last few years there have been a number of sensational developments in prime number theory. 1. Goldston, Pintz and Yildirim have shown that there are relatively small gaps between consecutive primes. 2. Yitang Zhang has adapted their method to show that there are infinitely many pairs of primes $p, p'$ with $0$

**Bounded Gaps Between Prime Numbers (3)**

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MATH 597C Multiscale Modeling and Computational Approaches with Applications in Biology, Materials Science and Engineering (3)** The goal of this introductory course is to present the ideas and techniques arising in the study of various multiscale problems that are ubiquitous in material science, engineering and biology. The course assumes basic knowledge of PDEs, real analysis and numerical methods. Due to the interdisciplinary nature of this course, the audience is anticipated to be a mix of graduate students in mathematics and other sciences. The necessary background in all areas will be presented based on the feedback from the class. Modeling issues will be discussed.
Multiscale Modeling and Computational Approaches with Applications in Biology, Materials Science and Engineering (3)

Dynamical Systems with Applications in Physics, Engineering and Biology (3)

General Education: None
Diversity: None
Bachelor of Arts: None

Prerequisite: None

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 597D Dynamical Systems with Applications in Physics, Engineering and Biology (3) The unifying theme of this course is an intuitive approach to dynamics. Key concepts will be given geometrical and physical motivations not found in most textbooks. Here is a more specific content of the course. Linear systems. Floquet theory, Sturm-Liouville theory and Krein theory. Adjoint linear systems and wave fronts. Lyapunov exponents. Applications: particle traps, celestial mechanics, vibrations. Chaotic behavior. Smale's horseshoe and its appearance in the dynamics of electric circuits, pendula, celestial bodies, billiards, particle accelerators etc. Ergodicity and some examples. Fractals and how they arise in differential equations of physics. Fractal dimensions. Robustness of random behavior. Some open problems. Stable behavior. Completely integrable Hamiltonian systems. A short introduction into averaging and into adiabatic invariance with examples from mechanics and electrodynamics.

Fractals and how they arise in differential equations of physics. Fractal dimensions. Robustness of random behavior. Some open problems. Stable behavior. Completely integrable Hamiltonian systems. A short introduction into averaging and into adiabatic invariance with examples from mechanics and electrodynamics.

Loop Groups (3)

General Education: None

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MATH 597E Loop Groups (3) Geometry and representation theory of loop groups. Central extensions, the Hilbert space Grassmannian, the determinant line bundle, positive energy representations, the Weyl-Kac character formula, affine Lie algebras, the Dirac operator.

Loop Groups (3)

General Education: None

The Pennsylvania State University
MATH 597F A Spectral Analysis Approach to Characteristic Boundary Layers (3) I will introduce various types of boundary layers in fluid dynamics, mostly focusing on the classical Navier-Stokes models. The main focus of the course is to analyze the dynamical stability and the asymptotic expansions near boundary layers. Most of these fundamental questions have been widely open for characteristic boundary layers. I'll present a spectral analysis approach to tackle these problems. The rough course outline is as follows: Introduction to boundary layers; Spectral analysis: spectrum of the linearization near boundary layers; Evans function, and the construction of unstable point spectrums for various boundary layers. Resolvent estimates and the study of linearized semigroups. Nonlinear stability and instability analysis and boundary-layer asymptotic expansions. Other possible applications.

A Spectral Analysis Approach to Characteristic Boundary Layers (3)

MATH 598 Special Topics (1-9) Formal courses given on a topical or special interest subject which may be offered infrequently; several different topics may be taught in one year or semester.

Special Topics (1-9)

MATH 599 (IL) Foreign Studies (1-12 per semester, maximum of 24) Full-time graduate-level foreign study at an overseas institution with whom linkages have been established.

Mathematics Education (MTHED)

MTHED 411 Teaching Secondary Mathematics I (3) Conditions for learning mathematics; problem solving; subject matter types; curriculum; learning goals; nature and history of mathematics at secondary level

MTHED 411 Teaching Secondary Mathematics I (3)

This is the first of two secondary mathematics methods courses. In this course, participants look at mathematics teaching and learning from a teacher's perspective as well as from a student's perspective. Course participants engage in mathematical problem solving and in the study of the history and nature of mathematics as the foundation for understanding current curriculum and standards. Lesson planning follows from the consideration of different types of mathematical content, including skills and concepts. Looking specifically at the learning of mathematics and questioning to promote higher-level thinking prepares students for field experiences in subsequent semesters.

The goals for the course are:
- To improve understanding of some of the mathematical concepts which are important in secondary school mathematics.
- To improve understanding of the nature of mathematics: what is important, how it is practiced, how mathematical validity is determined.
- To improve understanding of the historical development of selected topics from secondary school mathematics.
- To develop a vision of good school mathematics.
- To see mathematics, mathematics learning, and mathematics teaching as problematic and to develop an inquiry approach to and an ability to reflect on these domains.
- To increase understanding of secondary school students' mathematical thinking and understanding.
- To increase ability to specify subject matter involved in a specific mathematics topic and make distinctions among them.
- To improve understanding of various teaching strategies and their strengths and weaknesses.
- To increase ability to choose among lessons and curriculum materials based on the intended mathematical subject matter and the current understandings of the students.
- To increase insight into creating a thriving, supportive mathematics classroom culture.

Students are evaluated through written assignments, examinations, classroom performance, presentations, and lesson plans.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2007
Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MTHED 412W** Teaching Secondary Mathematics II (3) Assessing learning and instruction; methods of evaluation and grading; long-term planning; accommodating needs of diverse learners; connecting theory and practice.

**MTHED 420W** Teaching Secondary Mathematics II (3)

MTHED 412 is an inherently cumulative experience. This course builds upon ideas developed in MTHED 411 and MTHED 427. In particular, students continue to consider types of subject matter, problem solving, lesson planning, technology use, questioning, history and nature of mathematics, and curriculum and standards. MTHED 412 then links understanding of mathematics education with other education courses and with field experiences as well as with understanding of K-16 mathematics. Students focus on lesson and unit development and implementation, assessment and evaluation, classroom management and organization within school communities, and continued professional growth as reflective practitioners. Students are encouraged to draw whenever possible on education psychology, adolescent psychology, educational theory and policy, mathematics, and other bodies of knowledge. In other words, course participants live as teachers with a wealth of knowledge and responsibility to draw on that knowledge in the service of their students.

Student goals are to:
- Develop an expanded view of the process of teaching mathematics;
- Develop a deeper understanding of what it means to learn mathematics and the processes by which mathematics is learned;
- Be able to reflect on the instruction and one’s learning in MTHED 412 and to relate it to students’ learning of secondary mathematics;
- Be able to plan and teach appropriate mathematics lessons and reflect on one’s teaching;
- Be familiar with and be able to draw on a variety of teaching resources;
- Investigate current issues influencing evaluation in the secondary mathematics curriculum;
- Choose goals and content for middle school and high school mathematics courses;
- Develop strategies for assessing and evaluating what students have learned
- Create and implement assessment instruments for middle school and high school mathematics courses;
- Develop insights into student understanding, especially in relationship to exceptional students as well as to mathematically talented and challenged students;
- Identify the needs of diverse learners and to develop strategies to address these needs;
- Create classroom environments that are conducive to learning; and
- Incorporate appropriate technology in the teaching and learning of mathematics.

Students are evaluated through written assignments, examinations, classroom performance, unit lesson and evaluation plans. Throughout the course writing is a process to help students learn course content as well as to help students learn ways of writing needed in the work of the secondary mathematics teacher.

The course is offered each Fall and Spring semester with typical enrollment of 20-25 students in each of 1 or 2 sections. Through co-requisite course, CI 495C, students spend approximately five full weeks in secondary school classrooms.
MTHED 424 Contemporary School Mathematics Programs (3) In-depth analysis of school mathematics programs and the factors and forces influencing them; contemporary curriculum developments.

MTHED 427 Teaching Mathematics in Technology-Intensive Environments (3) Interaction among pedagogy, content, and technology in mathematics teaching and learning in technology-intensive environments; secondary, early college curricula; laboratory experience.

MTHED 430 Students' Mathematical Thinking (3 per semester, maximum of 6) Develop abilities in planning, conducting, and interpreting mathematics interviews to gain an understanding of students’ thinking processes and current knowledge.

MTHED 431 Data Analysis in Secondary School Mathematics (3) Intense development of foundations of data analysis for secondary mathematics as a process using statistical concepts for predictions and inferences.

As prospective secondary mathematics teachers, students will develop broad and deep understanding of measures of and representations for center, measures of spread, distribution, and correlation. They will become fluent in using dynamic statistics programs, various physical models, and representations to convey the essence of these statistical concepts to secondary school students. They will compare various statistical methods and measures and make and defend claims both in terms of the discipline and in terms of how these ideas unfold for learners in school mathematics. They will connect these statistical concepts to the broader study of secondary school mathematics.

In particular, students will see data analysis as a process. It involves the systematic application of statistical techniques, as well as logical techniques, to summarize, interpret, and compare data. Although the emphasis of the course will be on statistical concepts, one of the main themes of the course will involve understandings the mathematical structure of these statistical concepts. For example, students should be able to answer, from a mathematical perspective, why some data...
Intended as an elective for students in Secondary Education/Mathematics Education, the course helps students both to enrich and apply the pedagogical ideas and technology uses from their methods courses and to connect their collegiate mathematics experiences to school curricula. In particular, it helps to build prospective teachers’ understanding of statistics as a vital part of secondary mathematics. Class activities involve use of physical manipulatives and mathematics technology (e.g., spreadsheets, dynamic statistics environments, and graphing calculators), as appropriate.

Students in this course would be expected to complete weekly assignments and exams and to participate in classroom investigations of statistical concepts. Course grades depend on students’ performance on all of these measures.

MTHE 432 Mathematical Modeling in Secondary School Mathematics (3) Students work from teaching and curricular perspective to explore and apply school and undergraduate mathematics to model real-world phenomena.

MTHE 432 Mathematical Modeling in Secondary School Mathematics (3)

Given the attention to mathematical modeling and applications in secondary school mathematics, prospective teachers need to be able to recognize situations that allow secondary school students to use relevant mathematics to apply mathematics and to model real-world phenomena as a means to learn about various mathematical topics. This course provides experiences in generating, interpreting, and evaluating geometric, discrete, stochastic, and function models. The course also helps prospective teachers develop an understanding of how mathematical modeling arises in school mathematics and how students learn mathematics through modeling.

Intended as an elective for students in Secondary Education/Mathematics Education, the course helps students both to enrich and apply the pedagogical ideas and technology uses from their methods courses and to connect their collegiate mathematics experiences to school curricula. Class activities involve use of physical manipulatives and mathematics technology (e.g., spreadsheets, geometry construction environments, and graphing calculators), as appropriate.

Students in this course would be expected to complete a major modeling project and paper in addition to weekly assignments, exams, quizzes, and written reflections of classroom participation. Course grades depend on students’ performance on all of these measures.

MTHE 433 Function Concept in Secondary School Mathematics (3) This course develops the concept of function as an essential topic that underlies and connects school and collegiate mathematics.

MTHE 433 Function Concept in Secondary School Mathematics (3)

Prospective teachers as students need to understand the concept of function deeply as an essential topic of school and collegiate mathematics. In this course, they develop greater facility in using multiple representations and encounter function ideas as they unfold in multiple areas of mathematics, thus extending their understanding of collegiate mathematics and its connection to school mathematics. The students become conversant in current state and national expectations about functions as a mathematical entity. They plan appropriate instruction to develop secondary school student’s understanding of function.

Intended as an elective for students in Secondary Education/Mathematics Education, the course helps students both to enrich and apply the pedagogical ideas and technology uses from their methods courses and to connect their collegiate mathematics experiences to school curricula. In particular, it helps to build prospective teacher’s conceptual understanding of function so that they may draw more strongly on this understanding to engage secondary students in mathematics. Class activities involve use of physical manipulatives and mathematics technology (e.g., spreadsheets, geometry construction environments, and graphing calculators), as appropriate.

Students in this course would be expected to complete a major project and paper in addition to weekly assignments, exams, quizzes, and written reflections of classroom participation. Course grades depend on students’ performance on all of these measures.

MTHED 501 Foundations of Mathematics Education I: Learning (3) This course focuses on understanding and application of theories of mathematical thinking and learning in research and practice.

MTHED 501 Foundations of Mathematics Education I: Learning (3)

An understanding of what it means to learn mathematics, knowledge of extant theories of learning mathematics, and knowledge of the nature of students’ mathematical thinking at various grade levels are central to the work of mathematics educators. Research, curriculum development, classroom interactions with mathematics students, development of assessments, and many other activities in which mathematics educators engage all draw heavily on understanding and knowledge of mathematical thinking and learning.

Students in this course will develop a deeper understanding of classical and contemporary theories of mathematical learning and thinking and comparisons among these theories. Assignments in the course support students’ growth in applying these theories to frame research, to enhance instruction, to consider curriculum, to support teacher development, and to effect policy. A major project in the course builds students’ skills in investigating mathematical thinking and learning.

This course would be one of four required Mathematics Education courses for all doctoral students in the Mathematics Emphasis Area/Curriculum and Instruction Ph.D. program. [The other required courses are MTHED 502 Foundations of Mathematics Education II: Teaching; MTHED 503 Foundations of Mathematics Education III: Curriculum; and MTHED 504 Foundations of Mathematics Education IV: Teacher Development and Policy.]

Students in this course would be expected to participate in class discussion, complete weekly assignments, conduct two major projects, and respond to a final examination. Course grades depend on students' performance on all of these measures.

**MTHED 502 Foundations of Mathematics Education II: Teaching (3)**

Teaching is the object of study encountered through connections among classical and contemporary theories of teaching and research on teaching.

**MTHED 502 Foundations of Mathematics Education II: Teaching (3)**

Teaching mathematics and developing knowledge, skills, and dispositions of mathematics teachers are central tasks in the work of mathematics educators. Thus acquiring deeper theoretical knowledge and practical skills in teaching are fundamental objectives for doctoral students in mathematics education. The focus of this course is on teaching - and not the teacher - as an object of study.

In this course, students explore and connect classic and contemporary research and theories of teaching, come to know the nature of mathematics teaching in tradition and vision, relate theories of teaching to theories of learning, develop ability and disposition to study and improve mathematics teaching and hone ability to evaluate and conduct research on teaching.

This course would be one of four required Mathematics Education courses for all doctoral students in the Mathematics Emphasis Area/Curriculum and Instruction Ph.D. program. [The other required courses are MTHED 501 Foundations of Mathematics Education I: Learning; MTHED 503 Foundations of Mathematics Education III: Curriculum; and MTHED 504 Mathematics Education IV: Teacher Development and Policy. This course would typically follow MTHED 501.]

Students in this course would be expected to participate in weekly discussions, articulate their emerging philosophies of teaching, and analyze teaching episodes. Course grades depend on students’ performance on all of these measures.

**MTHED 503 Foundations of Mathematics Education III: Curriculum (3)**

Study of mathematics curriculum blends historical trends and current issues with research literature and techniques to study effects of innovations.

**MTHED 503 Foundations of Mathematics Education III: Curriculum (3)**

Mathematics educators who are active in leadership of school systems, teacher education, research and development projects, and formulation of education policy are frequently called on for analytic or creative work related to the school and collegiate curriculum. They are asked for advice on the content, organization, presentation, and evaluation of mathematics curricula and to conduct research directly related to curricula and the effects of their implementation.

Students in this course will develop a connected current and historical view of the nature of K-16 mathematics curriculum materials, movements, and guidelines. They will develop skills and dispositions to critique, conceptualize, design, conduct and report research on curriculum development and implementation efforts.

This course would be one of four required Mathematics Education courses for all doctoral students in the Mathematics Emphasis Area/Curriculum and Instruction Ph.D. program. [The other required courses are MTHED 501 Foundations of Mathematics Education I: Learning; MTHED 502 Foundations of Mathematics Education II: Teaching; and MTHED 504 Foundations of Mathematics Education IV: Teacher Development and Policy.]

In addition to participation in class discussions, students in this course would be expected to conduct a historical analysis of the treatment of a mathematical theme or topic in K-16 curricula, analyze and synthesize research related to an important issue, analyze instruments used in curriculum research, and propose a research study in some aspect of the mathematics curriculum. Course grades depend on students' performance on all of these measures.

**MTHED 504 Foundations of Mathematics IV: Teacher Development and Policy (3)**

Nature and study of teacher education and professional development programs and projects coupled with policy and impact in mathematics education.

**MTHED 504 Foundations of Mathematics IV: Teacher Development and Policy (3)**

One of the principal day-to-day responsibilities of mathematics educators is teaching of content and pedagogy courses for prospective teachers. This work often leads to opportunities for leadership through professional development courses and projects with in-service teachers and to consulting work with local, state, and national school, governmental, and professional organizations concerned about educational policy. Effective work in these arenas requires knowledge and practical skills about professional development and institutional change as well as awareness of policies and the role of policy in influencing practice.
Students study research and practice in teacher education and professional development of mathematics teachers. They come to know the research and the issues that confront those who prepare teachers and support teachers’ continued professional development. Students become familiar with governmental and professional organizations and the critical issues that impact the direction of mathematics education. They also learn how to study local, state, and national policies and publications.

This course would be one of four required Mathematics Education courses for all doctoral students in the Mathematics Emphasis Area/Curriculum and Instruction Ph.D. program. [The other required courses are MTHED 501 Foundations of Mathematics Education I: Learning; MTHED 502 Foundations of Mathematics Education II: Teaching; and MTHED 503 Foundations of Mathematics Education III: Curriculum.]

In addition to participation in class discussions, students in this course would be expected to articulate a policy regarding a critical issue in mathematics education, evaluate a teacher education or professional development program, propose a professional development or teacher education project, and complete a final examination. Course grades depend on students’ performance on all of these measures.

---

**MTHED 511 Connections Between Mathematics and Mathematics Education (3)**

Course connects college-level mathematics with secondary school mathematics in terms of curriculum content and research on teaching and learning.

The course is organized around key areas of college-level mathematics. In each area, the college-level mathematics focus is on critical ideas, such as fundamental concepts, powerful techniques, and important theorems. These ideas are then explored as abstractions of secondary school mathematics content and as justifications for procedures taught in secondary schools. Resulting new mathematics understandings will be used to understand research on learning and teaching mathematics and to apply research to secondary school mathematics instruction. Mathematics curriculum expectations will include both mathematics content topics and mathematical practices and processes.

---

**MTHED 520 Analysis of Research in Mathematics Education (3)**

Survey of the status of knowledge about mathematics learning and instruction, K-12; analysis of research procedures; instruments for evaluating research.

---

**MTHED 523 Projects in Mathematics Education Research, Curriculum Development, and Evaluation (1-3 per semester, maximum of 24)**

Conceptualizing, designing, conducting, and reporting mathematics education research, curriculum development and/or evaluation projects.

---

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Mechanical Engineering (M E)

M E 400 Thermodynamics of Propulsion and Power Systems (3) Analysis and modeling of propulsion and power systems, including combustion, compressible flow through nozzles, chemical equilibrium, and moist air systems.

M E 400 Thermodynamics of Propulsion and Power Systems (3)
This course is specifically designed to take advantage of the senior level standing of the student by providing an integrative modeling and analysis approach to thermal-fluids systems. The course emphasizes the integration and application of fundamental principles of mass, momentum, and energy conservation to relatively complex systems. These systems include spark-ignition and diesel engines, gas-turbine engines for power production, and turbojet engines. The integration of the topics of combustion, compressible flow, and psychrometrics allow these systems to be analyzed in their totality. Emphasis is on creating engineering models of these systems. The course aims to integrate previous knowledge and develop skill in “thinking like an engineer.”

M E 402 Power Plants (3) A study of fossil-fuel steam generation and utility plants, including cogeneration, gas turbine, and combined cycles.

M E 402 Power Plants (3)
This course serves as an introduction to fossil-fuel plants for both steam generation and electricity production. Following an overview of an entire plant and an introduction to combustion processes, each subsystem of a fossil-fuel plant will be considered. The subsystems include fuel preparation and handling, boiler types and the fundamentals of steam generation, water systems (condensate-feedwater, makeup, cooling, and waste), and turbomachinery. Consideration will be given to environmental aspects of steam and power generation as well as operations, maintenance, and controls issues. Students will spend time at the West Campus Steam Plant (WCSP) to observe the various systems discussed in class. Data taken from the WCSP will be used in problem solving and in an assessment of the plant.

Course Objectives:
To acquaint students with both steam generation and electricity production and to present some of the engineering calculations encountered in practice.

Objectives that students will meet at the end of the course:
1. list the subsystems of a plant, indicating the function of each subsystem
2. sketch typical subsystems of a power plant (example: sketch the coal and ash handling system)
3. perform basic analyses associated with each subsystem
4. sketch the flow of water-steam, fuel, and air through a plant
5. analyze a heat balance, perform an availability analysis, and interpret the results of those analyses
6. select the type of plant appropriate for a given application
7. perform an energy audit on the auxiliary systems
8. perform a water audit on the plant
9. use DoE Best Practices (or equivalent program) to assess a steam plant

Students will be required to draw on material from core undergraduate courses in thermodynamics (M E 030 and M E 031), fluid mechanics (M E 033), and heat transfer (M E 412). Students must be able to:
- sketch the configuration and draw a T-s diagram for a Rankine cycle and a Brayton cycle
- define the basic modifications to the simple Rankine cycle and simple Brayton cycle
- discuss the significance of the modifications
- state the definition of the adiabatic efficiency for turbines and pumps
- perform an energy balance given a particular cycle
- use the Darcy-Weisbach equation to determine the friction losses in pipes and ducts
- perform simple analysis of a heat exchanger

The Pennsylvania State University
ME 403 Polymer Electrolyte Fuel Cell Engines (3) Introduction to Fundamentals of Polymer Electrolyte Fuel Cells (PEFCs). Includes fundamentals of electrochemistry, thermodynamics, fluid mechanics, heat transfer materials, and manufacturing issues of PEFCs. A brief survey of other fuel cell types is also included.

This course is intended for the engineering student interested in obtaining a fundamental background required for polymer electrolyte fuel cell (PEFC) modeling and diagnosis. Those students with interest in the basic design, operation, and characteristics of PEFC systems should also benefit.

This course serves as an introduction to the fundamental principles of electrochemistry, thermodynamics, heat and mass transfer, materials and manufacturing issues related to PEFC engines. The various types of PEFC components and technologies are dissected in detail, including direct inject alternative fuel systems. A survey of cutting-edge issues in fuel cell technology including the future direction of PEFC technology will be presented as time permits. The student will also participate in an experimental lab study to aid in the understanding of these systems, a computer-based simulation project, and a group-based fuel cell system design project. Issues of specific interest to mechanical engineers, including water management and heat and mass transfer in thin film porous media, will be dealt with in depth. A brief survey of other fuel cell types is also presented.

ME 404 Gas Turbines (3) Thermodynamic cycles relating to gas turbines; analysis and performance of compressors, combustion chambers, single- and multi-stage turbines; recent developments.

This course enables students with the proper background to gain specialized knowledge as a step towards becoming practitioners in the field of gas turbines. The information imparted covers from basic cycles to properties of materials required to put together these impressive machines. Competent course performance requires knowledge of basic thermodynamics, fluids and heat transfer. The homework is carefully graduated in order to highlight key aspects already covered in the lectures, with new thinking an unavoidable part. As an optional part of the course, students can run and acquire data in an actual gas turbine. Additionally, those with a strong background in fluids can design blades and study the flow around them with CDF.

Course Objectives: Upon completion of this course, students should be able to:
1. Analyze cogeneration plants.
2. Analyze turbfans, jets and turbojets.
3. Specify a typical gas turbine installation, including auxiliaries.
4. Carry out conceptual design of gas turbine engines for different applications.
5. Specify construction materials to withstand typical operating conditions.
6. Demonstrate professionalism in interactions with colleagues, faculty, and staff.

Program Objectives: This course covers the following program objectives:
1. demonstrate ability to solve differential equations
2. demonstrate familiarity with linear algebra
3. perform analysis of thermal/fluids components
4. perform analysis of thermal/fluids systems
5. work effectively on multidisciplinary teams
6. demonstrate ability to communicate effectively with the written word
7. demonstrate ability to communicate effectively in oral communications
8. demonstrate professionalism in interactions with colleagues, faculty, and staff
M E 405 Indoor Air Quality Engineering (3)

This course serves as an introduction to environmental health engineering, which presents the quantitative relationships describing generation, movement, and control of pollutants inside the workplace. Although some aspects of the course can be applied to outdoor air pollution, the course concentrates on applications related to indoor air quality. In particular, students are taught how to measure and predict concentrations of air pollutants, both gaseous and particulate, in rooms. In addition, they are taught how to design both local and general ventilation systems to maintain acceptable indoor air quality. In addition, the design of air pollution control systems that remove both gaseous and particulate contaminants from the air is discussed.

The relationships are described by mass and energy balances that relate pollutant generation and movement to process parameters. The course is designed for seniors and graduate students in Mechanical, Chemical, Environmental and Civil Engineering, and Meteorology.

To work effectively in environmental health engineering, students must be proficient in applying the thermal sciences. The course uses principles of mathematics and thermal sciences included in accredited programs of engineering. Most students will have mastered some of these principles, but few will have mastered them all. The course reviews all the necessary thermal science principles before using them, but some students will need to review this material in more detail than others.

This course is offered once per year.

Course Objectives:
- Demonstrate the ability to analyze and compare risks associated with various activities and with exposure to hazardous chemicals.
- Demonstrate a working knowledge of the physiology and function of the respiratory system, including diseases of the lung.
- Demonstrate the ability to estimate pollutant emission rates using emission factors and fundamental mass balance techniques.
- Analyze practical problems of general and local ventilation requirements.
- Design local ventilation systems using standard guidelines from ACGIH and ASHRAE.
- Predict the motion of particles in air, and analyze pollution control devices which remove particles from the air.
- Demonstrate professionalism in interactions with colleagues, faculty, and staff.

Program Objectives:
- Demonstrate knowledge of chemistry
- Demonstrate ability to solve differential equations
- Demonstrate familiarity with statistics
- Perform analysis of thermal/fluids components and thermal/fluids systems
- Demonstrate an appreciation of the economic, global, social, and ethical context of their work
- Demonstrate professionalism in interactions with colleagues, faculty, and staff
- Make effective use of spreadsheets as an analysis and design tool
- Use software such as Matlab and MathCAD to solve engineering problems including ODE's, systems of linear equations, and numerical integration

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2007
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

M E 406 (NUC E 406) Introduction to Statistical Thermodynamics (3)

This course is an introduction to probabilistic and statistical concepts in the physical sciences, which we refer to as "statistical thermodynamics." In areas such as design and processing of electronic devices, materials engineering, chemical engineering, and combustion engineering, the science of statistical mechanics is a particularly necessary, powerful, and important tool for the engineer. The underlying foundation of statistical mechanics is developed by (1) reviewing the basic ideas from probability theory, (2) deriving the binomial, Poisson, and Gaussian probability distributions, and (3) using these models to analyze several examples taken from science and engineering. To make a connection between macroscopic quantities and the corresponding probabilistic representation, classical thermodynamics is reviewed using the internal energy, entropy, and free energy functions in the context of the first and second laws. Statistical mechanics for classical and quantum-mechanical systems is presented via the micro-canonical, canonical, and grand canonical ensembles using the associated partition functions. During the syntheses of ideas, applications from various branches of
science are presented. Some examples of applications are the Einstein crystal, the Debye crystal, the ideal gas, and black body radiation.

This course covers the following program objectives:
1. Demonstrate knowledge of basic chemistry and physics.
2. Demonstrate a knowledge of atomic and nuclear physics.
3. Demonstrate a knowledge of thermodynamics, heat transfer, and fluid flow.
4. Understand and apply the basic concepts of particle transport.
5. Understand and apply thermodynamics and heat transfer principles to the analysis of nuclear power components and systems.

M E 410 Heat Transfer (3) Thermal energy transfer mechanisms: conduction (steady, transient), convection (internal, external), radiation; lumped parameter method; heat exchangers; introduction to numerical methods.

M E 410 Heat Transfer (3)

M E 410, Heat Transfer, is a required course for mechanical and nuclear engineering students. The course presents the three modes of heat transfer: conduction, convection, and radiation. One-dimensional steady and transient conduction is studied for planar, cylindrical, and spherical geometries. The lumped capacitance analysis is used for transient conduction when appropriate. Analytical and numerical methods are presented for two-dimensional conduction problems, including the analysis of extended surfaces. Convection heat transfer is studied in both internal and external geometries and under laminar and turbulent flow regimes. External flows include cooling on flat plates due to laminar and turbulent boundary layer flows, and cooling of cylinders due to cross flow. The convection heat transfer analysis in internal flows considers laminar and turbulent pipe flows. Free convection is also considered where heat transfer is due to flow induced by fluid buoyancy. Boiling and condensation considers the effect of two-phase flows on surface heat transfer. Radiation heat transfer is studied by considering both the general characteristics of radiation as well as the properties of radiating surfaces and radiation heat transfer between surfaces. Methods for solving multi-mode heat transfer are presented throughout the course. Heat exchangers and heat transfer from extended surfaces are two applications studied in the course.

M E 421 Viscous Flow Analysis and Computation (3) Apply analytical and computational methods to solve the differential equations describing fluid flow. Incompressible external flows past objects and internal flows in pipes and ducts are some problems considered.

M E 421 Viscous Flow Analysis and Computation (3)

M E 421 is an intermediate course in fluids mechanics that bridges between the required undergraduate fluid mechanics course and the graduate fluid mechanics courses. Steady and unsteady flows are considered past objects and in pipes, ducts, and annuli. Analytical and numerical methods are used to solve the boundary layer and Navier-Stokes equations that describe fluid motion. Analytical methods include solutions for steady and unsteady internal flows with heat transfer. Similarity equations for boundary layer flows are derived and then solved numerically using the Runge-Kutta method. Finite difference methods for viscous flows are introduced and applied. Turbulence modeling is presented and applied in a boundary layer code. The stages of transition from laminar to turbulent flow and methods for the prediction of transition are introduced.

Topics in M E 421 include:
1. Analytical solutions for one-dimensional viscous flows in Cartesian and cylindrical coordinates with heat transfer.
2. Unsteady viscous flow solutions using Separation of Variables.
5. Finite-differenced equations for viscous flows and the accuracy and stability of the schemes.
6. Using a commercial CFD code for a simple geometry.
7. Algebraic turbulence models and the approximations of each.
8. Higher-order turbulence models and the approximations used.
9. Stages of transition from laminar to turbulent flow.
10. Methods to predict boundary layer stability and transition.

M E 427 Incompressible Aerodynamics (3) Analysis of lift and drag using potential flow theory, effects of viscosity on potential flow calculations, wind tunnel testing.

M E 427 Incompressible Aerodynamics (3)
The primary objective of this course is to teach students how to determine aerodynamic lift and drag using a variety of techniques, including potential flow theory, viscous flow analysis, and wind tunnel testing. Students will also learn the limitations of each technique and how they can be used together to obtain better results. Fundamental concepts in aerodynamics are also discussed, including lift, drag, aerodynamic moment, induced drag, viscous drag, pressure drag, separation, stall, circulation, downwash, camber, thickness ratio, and lift distribution. Students should be able to use knowledge gained in this course to solve aerodynamic design problems.

Students will be evaluated through the use of written exams during the semester, a comprehensive written final, and weekly homework assignments. This course is a technical elective in the Mechanical Engineering program and allows students who have completed ME BD 240, Elementary Fluid Mechanics, to improve their understanding of fluids by covering the subject in more detail and applying it specifically to aerodynamics problems. It will usually be offered annually in the spring semester.

Diversity: None
Bachelor of Arts: None
Effective: Fall 2007
Prerequisite:

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**M E 428 Applied Computational Fluid Dynamics (3)**

The purpose of this course is to teach students how to use a commercial CFD code to solve real-world engineering fluid flow problems. The definition of appropriate problem domain, set of governing equations, boundary conditions, and fluid properties is discussed. Sufficient theory of CFD is covered so that students are able to select appropriate elements or interpolation techniques and options, mesh size, pressure-correction technique and solution technique. Students are also taught how to interpret the results of a CFD simulation, including determination that the solution is physically realistic, conforms to the governing equations, is converged and grid independent, and determination of important engineering quantities such as net force, pressure drop and flow rate. Students are evaluated through the use of written exams during the semester, a comprehensive written final, weekly homework assignments, and a semester project. This course is a technical elective in the Mechanical Engineering program and allows students who are interested in fluid mechanics and heat transfer to further their study. It is offered periodically.

**M E 430 (EGEE 430) Introduction to Combustion (3)**

This course provides an introductory treatment of combustion science. The objectives of the course are to develop in the students an understanding of combustion kinetics, combustion thermochemistry, flame dynamics, flame stability, and pollutant formation. Coverage includes laminar and turbulent flames, premixed and diffusion flames, and detonations. Emphasis is placed on the role that Kinetics, heat transfer, mass transfer, and fluid dynamics have on flame structure and flame stability. The course includes some laboratory demonstrations of flat flame and diffusion flame burners, and incorporates numerical calculations of thermodynamic and kinetic combustion phenomena. The course begins with a review of transport phenomena, physical gas dynamics, and thermochemistry. Then, the concept of the laminar flame speed is introduced in the context of a one-dimensional flame and a propagating chemical wave. Issues of premixed flame structure and stability are presented along with a discussion of flammability limits. Next, laminar diffusion flames are presented via the Burke-Schumann analysis. From laminar flames, the emphasis shifts to turbulent premixed and diffusion flames, and the concepts of flame stretch and strain. Detonations are considered, with emphasis on thermodynamic analysis of the detonation and the structure of the detonation wave. Details of chemical kinetics for the hydrogen-oxygen and hydrocarbon-air reaction systems are presented, with linkage back to earlier topics such as flame stabilization and flammability limits. After kinetic phenomena, the course then considers pollutant formation focusing on soot and NOx. The fundamental aspects of combustion are applied to analysis of the combustion process and pollutant formation in international combustion engines and catalytic combustors. The course wraps up with discussion of atmospheric chemistry, the fate of pollutants, and the formation of secondary pollutants.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details
M E 431 Internal Combustion Engines (3) Thermodynamic aspects of internal combustion engine design and performance; two- and four-stroke cycle, supercharged and non-supercharged, diesel and spark-ignition types.

M E 431 Thermodynamics of Propulsion and Power Systems (3)

This course is specifically designed to take advantage of the senior level standing of the student by providing an integrative modeling and analysis approach to thermal-fluids systems. The course emphasizes the integration and application of fundamental principles of mass, momentum, and energy conservation to relatively complex systems. These systems include spark-ignition and diesel engines, gas-turbine engines for power production, and turbojet engines. The integration of the topics of combustion, compressible flow, and psychrometrics allow these systems to be analyzed in their totality. Emphasis is on creating engineering models of these systems. The course aims to integrate previous knowledge and develop skill in "thinking like an engineer."

M E 433 Fundamentals of Air Pollution (3) Natural and man-made sources of pollution; atmospheric dispersion; biological and health effects; control systems; legislation and regulations.

M E 433 Fundamentals of Air Pollution (3)

In this course, students will learn basic techniques for modeling and analyzing linear multidegree-of-freedom (MDOF) mechanical systems, and will learn how to use these techniques for mechanical design. Students will learn to obtain equations of motion using energy methods (Lagrange's equations), with emphasis on the efficient formulation and reduction to the linear case. The basic theory of MDOF systems will be presented, including: eigenvalue problems; natural frequencies and normal modes; superposition and modal analysis; and frequency response. Numerical methods for solving static, dynamic and eigenvalue problems will be presented. Introductions to the theory of linear continuous systems and experimental methods of vibrations will be presented. A substantial portion of the course will be spent discussing design applications of the basic theory, such as: finite element numerical analysis and experimental modal analysis of beams and plates; vehicle suspension design; and vibration isolation and absorption.

M E 440W Mechanical Systems Design Project (3) Design and analysis of mechanical components and systems. Application of fundamental design and analysis methods to open ended engineering problems.

M E 440W Mechanical Systems Design Project (3)

Students develop and practice skills and techniques for managing and executing engineering design projects. These skills are applied to an industry-sponsored project. Project teams perform all facets of product and process design. This includes problem identification, planning of the project, formulation of design specifications, the development and evaluation of alternative conceptual designs, the development of detailed designs, the specification of manufacturing processes, prototyping of manufacturing processes and parts, and analysis and documentation of results. Students will visit industrial sites to gain an understanding of existing processes and problems and to assess the customer's needs. Students will present their design process and final design in several formats: oral presentations, poster presentations, web pages, and reports.

M E 442W Advanced Vehicle Design I (2) Part one of a two course sequence; applications of design and analysis methods to open-ended advanced transportation vehicles. Two semester course; satisfies Senior Design or ME Technical Elective requirements (when combined with M E 443W).

M E 442W Advanced Vehicle Design I (2)

Students develop and practice skills and techniques for managing and executing engineering design projects. This is done in the context of an international University-level engineering design competition that is sponsored by government agencies and/or by industry. The competitions are structured to span a full calendar year, with the competition itself taking place in late Spring. For that reason, the course is spread over two semesters. In the Fall semester, there is approximately equal emphasis on classroom lectures and hands-on laboratory activities; in the Spring semester, the emphasis is on hands-on laboratory activities. The focus is advanced powertrain technology for personal transportation vehicles. Broader aspects of energy efficiency, security, and sustainability also will be discussed. The specific technologies that are targeted will evolve with time to remain ahead of what is available in current production vehicles. Project teams perform all facets of product and process design. This includes problem identification, planning of the project, formulation of design specifications, the development and evaluation of alternative conceptual designs, the development of detailed designs, the specification of manufacturing processes, prototyping of manufacturing processes and parts, and analysis and documentation of results. Students also will participate in broader aspects of the design competition. This may include securing sponsorship and funding, participating in outreach and public relations events, developing a business plan, developing a web site, and traveling to competition workshops and to the annual competition. Students will present their design process and final design in several formats: oral presentations, poster presentations, web pages, and reports.

M E 444 Engineering Optimization (3) Problem formulation, algorithms and computer solution of various engineering optimization problems.

M E 444 Engineering Optimization (3)

Students will learn to formulate and solve a variety of engineering optimization problems. Basic concepts, problem formulation, scaling, use of different optimizers, effect of tuning parameters and starting points and solution interpretation will be taught. Example problems will be taken from mechanical, aerospace, nuclear, civil, chemical, electrical and other engineering disciplines. This course will complement other engineering design courses, such as capstone design. Students will learn how optimization can reduce product turnaround time, and to make decisions involving weight, stiffness, strength, performance, energy utilization, and other attributes. Pedagogy will focus on hands-on experience through computational problem-solving and graphical understanding. Technology classrooms and computer labs for instruction will be used. A by-product of this course is increased math and computer skills.

M E (NUC E) 446 Reliability and Risk Concepts in Design (3)
The course covers materials reliability in design including mechanical, electrical and system aspects. Five main topics will be studied. The course starts by introducing engineering risk and reliability, highlighting its interdisciplinary nature and its significance in system design. The concept of reliability as a probability is introduced and the basic laws of probability are reviewed. The discussion centers on the mathematics needed to understand and analyze complex systems including components in series and parallel. The topics include the independence, mutual exclusivity, truth tables and Venn diagrams. These concepts are then applied to simple systems consisting of one, two and three components in various configurations. The equivalency of the various methods is discussed. The effect of maintenance on a system’s reliability is presented along with discussions of various maintenance strategies. Then, the failure modes and effects analysis is introduced and examples discussed. The concept of fault trees and event trees and their application to reliability analysis are presented. Risk analysis is then introduced as a case study in the application of reliability analysis. A nuclear power plant system is analyzed to quantify the risk to the public from its operation.

M E 448 Engineering Design Concepts (3) Engineering design and modelling, engineering economic analysis techniques, technical communication skills, project planning and design.

M E 448 Engineering Design Concepts (3)
This course is the first of a two-part sequence of courses that make up the capstone design experience in the ME BD major (the second course is M E 449, Mechanical Design Projects). In this course students study the engineering design process, begin working on their senior design project, and learn about professional topics related to industry. Topics in the engineering design process include customer needs identification, development of engineering specifications, concept generation, concept selection, costing, and project planning. Professional topics include communication, team work, ethics, safety, sustainability, globalization, and engineering economics. Students are evaluated on the design process and professional topics through assignments and quizzes. A major component of the course is to begin work on a capstone design project. Students work in teams of 3 to 4 on an industrially-sponsored project or other project approved by the faculty. The student teams work with the sponsor to develop specifications and a project plan, perform background research necessary to fully understand the project, begin to solve the problem, and make two presentations during the semester. The first presentation is a formal project proposal; the second presentation at the end of the semester is a progress report. Students are evaluated on both their technical and presentation skills, as well as their ability to function as a team. This course is required in the Behrend Mechanical Engineering (ME BD) program, and integrates material from a number of previous courses.

Modeling of Dynamic Systems (3)
M E 452 Vehicle Road Dynamics (3) Investigations of three-dimensional dynamics and design into the study of vehicle dynamics including tire forces, suspension, and stability.

M E 455 Automatic Control Systems (3) Dynamic analysis of systems involving automatic control of position, speed, power, flow, pressure, temperature, and other physical quantities.

M E 456 Industrial Robot Applications (3) Introduction to robotics, with emphasis on robot selection, programming, and economic justification for manufacturing applications.

M E 460 Advanced Machine Design Problems (3) Special machine design problems in unusual types of springs; gear problems and involutometry; cam design and application; multiple diameter shaft deflections and ball bearings.

M E 461 Finite Elements in Engineering (3) Computer modeling and fundamental analysis of solid, fluid, and heat flow problems using existing computer codes.
This is an introductory course in the Finite Element Method. Through this course, students gain knowledge in finite element theory and problem modeling. The mathematical formulation of the method is presented and then applied to problems in elasticity and heat transfer. Projects are assigned to demonstrate the finite element method in simplified problems using hand-calculations and computer programs such as Matlab. The use of commercial FEA programs is introduced and problems of increased complexity are assigned to demonstrate their use in a computer lab. Finally, problems of realistic complexity are assigned such that students can practice solving, documenting and presenting their use of commercial FEA programs.

**M E 462 Lubrication in Machine Design (3)** Lubricants and lubrication with applications to design aspects of machines and mechanisms including bearings, gears, cams, and automotive engines.

**M E 462 Lubrication in Machine Design (3)**
The course covers interdisciplinary materials on lubrication in machine design including mechanical, mechanics and chemistry aspects. Six main topics will be studied. The course starts by introducing engineering tribology, highlighting its interdisciplinary nature and its significance in machine design. Surfaces of machine components in contact are studied, including surface physiochemistry, surface topography, topographical measurements and characterization and classification of regimes of lubrication. Lubricants used in machine design are discussed in length, including types of industrial lubricants, properties of lubricating oils: compositions, viscosity and additives, synthetic lubricants and engine oils. The course will develop the theory of fluid-film lubrication, including the mechanisms of pressure generation, configuration of tribo-contacts and the Reynolds equation. Hydrodynamic lubrication is studied. The topics include the machine components with hydrodynamic lubrication, thrust bearings, journal bearings and design considerations of these devices. The last topic to be covered is the theory and application of Elastohydrodynamic lubrication (EHL). First, the machine components with concentrated contacts are introduced. Then, the Hertz theory of contact in studied and the governing equations for EHL are derived. Thermal EHL and traction are studied, and design calculations for rolling bearings, cams and gears are developed in relation to the geometrical and kinematic features of these components.

**M E 465 Introduction to Manufacturing Laboratory (1)** A laboratory-based introduction to manufacturing processes including material removal, forming, casting and joining for metals and non-metals.

**M E 465 Introduction to Manufacturing Laboratory (1)**
This laboratory course provides an integrated approach to Manufacturing Science and Engineering. The laboratory examines common techniques for fabricating parts; providing an introduction to several basic processes for creating both metallic and polymeric parts. As a part of this course, students will be exposed to compressive, tensile, sheet, bending, casting and powder metal processes. Using basic material science principles, students will examine concepts such as material flow, springback, and cold working. The course requires hands-on involvement by the students in the planning of experiments as well as data manipulation and analysis of results. The laboratory exercises are intended to provide students with a broad appreciation of the breadth of Manufacturing Science and Engineering. Students work in groups. Written reports and in-class exercises are the primary basis for grading.

This course is a technical elective.

**Applied Finite Element Analysis (3)**

General Education: None
ME 468 Engineering for Manufacturing (3) Manufacturability, the selection of the most effective materials and processes, and quality assurance.

ME 468 Engineering for Manufacturing (3)
This course will present an overview of the various manufacturing techniques that are currently used within industry. The advantages and disadvantages of each manufacturing technique will be discussed along with common defects that occur with each process. The start-up, operating, maintenance, and labor costs of each process will be presented along with general manufacturing economical concerns. Statistics and Quality assurance topics will also be covered, along with manufacturability and design for manufacturing concepts.

ME 469 Metallic Manufacturing Processes (3) Principles of metal working and introduction to current theories; analysis of deformation, joining, and metal removal processes.

ME 469 Metallic Manufacturing Processes (3)
In this integrated lecture/laboratory course students will learn a) metal deformations techniques such as: forging, rolling, extrusion and drawing, b) metal removal techniques for single, multi and infinite point cutting, and c) metal fastening techniques, including bolts, rivets and welds. As a part of the learning process, students will directly compare existing standards and theories to actual laboratory results. Students will learn how to assess the accuracy of both theoretical derivations and experimental procedures by first deriving theoretical equations in the classroom and then directly examining the ability of the equations to predict the given behavior by actually performing the manufacturing operation in the laboratory. Based on in-depth discussions regarding assumptions, approximations, and experimental error, students will assess the ability of the current state-of-the-art techniques to accurately predict the forces generated/required during various manufacturing metal working operations. In addition, students will derive their own theories by removing/improving some assumptions within the existing theories. For processes where multiple theories exist, students will compare and contrast the predictive abilities of the various techniques to those found through controlled laboratory experiments. Similar comparisons will also be made for processes where both engineering standards and theoretical techniques exist.

ME 470 Analysis and Design in Vibration Engineering (3) Application of Lagrange's equations to mechanical system modeling, multiple-degree-of-freedom systems, experimental and computer methods; some emphasis on design applications.

ME 470 Analysis and Design in Vibration Engineering (3)
In this course, students will learn basic techniques for modeling and analyzing linear multidegree-of-freedom (MDOF) mechanical systems, and will learn how to use these techniques for mechanical design. Students will learn to obtain equations of motion using energy methods (Lagrange's equations), with emphasis on the efficient formulation and reduction to the linear case. The basic theory of MDOF systems will be presented, including: eigenvalue problems; natural frequencies and normal modes; superposition and modal analysis; and frequency response. Numerical methods for solving static, dynamic and eigenvalue problems will be presented. Introductions to the theory of linear continuous systems and experimental methods of vibrations will be presented. A substantial portion of the course will be spent discussing design applications of the basic theory, such as: finite element numerical analysis and experimental modal analysis of beams and plates; vehicle suspension design; and vibration isolation and absorption.
M E 471 Noise Control in Machinery (3)
Course Objectives: This course prepares students to perform effectively as noise control engineers in industries with noise and vibration applications, e.g., during the early stages in product design or environmental noise control in industrial settings. Much of the material presented builds on second and third year courses covering such topics as dynamics, vibration, fluid mechanics and electrical components. Hands-on laboratory experiments (both programmed and open-ended) coordinated with focused lectures provide students with a working knowledge of the disciplines associated with noise and vibration and their practical applications for identifying, analyzing, and solving real world problems. The first part of the course centers on learning modules that cover the fundamentals of acoustics and noise control. Each module consists of two lectures followed by a laboratory experiment that demonstrates the relevant principles. These take place in small group settings (8 students maximum). Students are required to write individual reports based on the results of each of the laboratory experiments. The modules are followed with a laboratory project competition wherein each small group is given a noisy, small machine with the challenge to reduce its noise and vibration signatures. The course concludes with formal Power Point presentations of the results from each small group to an assessment team consisting of the industrial sponsors and selected professors and graduate students. This course is offered annually during the fall semester with an enrollment limited to 32 students (8/laboratory group).

M E 480 Mechanism Design and Analysis (3)
The student who takes this course will develop a basic understanding of the analysis and synthesis of planar linkage mechanisms. Students will develop the ability to model real linkage mechanisms using kinematic diagrams, including identification of links and joints. They will also learn to use Gruebler's equation to calculate the mobility or number of degrees of freedom of linkages based on the kinematic diagram. Students will also become familiar with real mechanism applications in the context of mechanism synthesis, where they will learn to determine the required dimensions of a mechanism for a specific application. Students will apply these dimensional synthesis methods in a design project which includes building a simple linkage prototype. They will learn kinematic analysis methods, i.e., analysis of position, velocity, and acceleration of planar linkages. These methods consist of graphical, algebraic, and complex number approaches. Students will also learn to use commercial software packages, e.g., Working Model, to predict position, velocity, and acceleration of planar linkages, and will compare their predictions to those using analytical approaches. Finally, students will learn to do dynamic force analysis of planar linkages to predict joint forces and motor torques. They will use commercial software packages to predict joint forces and motor torques of planar linkages, and will compare their predictions to those using analytical approaches.

M E 481 Introduction to Computer-Aided Analysis of Machine Dynamics (3)
This course addresses computer methods for kinematic and dynamic analyses of two-dimensional (2D) multi-body machines at the advanced undergraduate and introductory graduate level. The course introduces the formalism of kinematic mobility and topology to help students recognize constrained kinematic chains embedded in larger engineering systems. Classic kinematic and Newtonian dynamic methods are reformulated using modern matrix methods. The latter half of the course focuses on underlying algorithms and theory behind commercially available mechanism analysis software packages that employ differential-algebraic equation (DAE) solvers. Students program their own numerical integration methods for time domain simulation of forward dynamics of a simple system to reinforce the theory. The overall goals are for students to be able to identify forward versus inverse dynamic problems; and to be able to plan,
implement and debug an appropriate computer-based design tool to analyze kinematics and dynamics of 2D constrained mechanisms.

**M E 491 Bioengineering Applications of Mechanical Engineering (3)** Application of mechanical engineering knowledge in the context of life sciences.

The primary objective of this course is to teach students how to apply mechanical engineering knowledge in the context of life sciences. Fundamental mechanical engineering knowledge such as solid mechanics, fluid mechanics and system dynamics will be reviewed first. Then, different topics in bioengineering, such as motion biomechanics, physiological fluid mechanics, modeling of physiological systems, and rehabilitation engineering will be discussed. Throughout the semester, students also work in groups to solve several simplified real-life bioengineering projects. Students will be evaluated through these projects plus a final project presentation, an application presentation and several homework assignments. This course is a technical elective in the ME BD program and allows students who have completed their junior year to learn the application of mechanical engineering knowledge in the life science context.

**M E 494 Research Project (1-12)** Supervised student activities on research projects identified on an individual or small-group basis.

**M E 494H Senior Thesis (1-9)** Students must have approval of a thesis adviser before scheduling this course.

All Schreyer Scholars are required to complete an undergraduate honors thesis. This work represents the culmination of a student's honors experience. Through the thesis, the student demonstrates a command of relevant scholastic work and a personal contribution to that scholarship.

The thesis project can take many forms - from laboratory experiments all the way to artistic creations. The thesis document captures the relevant background, methods and techniques, as well as describing the details of the completion of the individual project. Two Penn State faculty members judge the merits of this Scholar's honors thesis, the student's self-selected thesis supervisor and the department-selected honors adviser in the student's area of honors.

**M E 495 Internship (1-18)** Supervised off-campus, nongroup instruction including field experiences, practica, or internships. Written and oral critique of activity required.

M E 530 Fundamentals of Combustion (3) Theoretical formulations and methods of solution of engineering problems and physical/chemical processes in various propulsion systems.

M E 530 Fundamentals of Combustion (3)

This course is devoted to the fundamentals of chemically reactive flow systems with application to modern jet, rocket, air-breathing engines, and other power generation systems. Experimental and theoretical foundations of steady-state reactions of homogeneous gas mixtures; application of mass and heat diffusion concepts to premixed and non-premixed gaseous flames, liquid-fuel droplet combustion; detonation waves, deflagration-to-detonation transition processes; ignition of gaseous mixtures. Methods for evaluation of thermal and transport properties of gases and liquids will also be discussed. While there are no prerequisites for M E 531, this course serves as a prerequisite for M E 532 (Turbulent and Two-Phase Combustion).

The course will:
1) help students acquire a better understanding of the fluid flow, heat transfer, and chemical reaction processes in combustion systems by presenting a systematic description of various analyses developed for describing the fundamental processes involved in chemically reacting flow systems;
2) demonstrate the usefulness of basic principles by performing analyses and obtaining solutions for various combustion problems encountered in engineering so that individuals can utilize them to solve "real-world" problems.
3) provide graduate students with the opportunity to demonstrate their abilities to absorb new materials and to present project results to the class.

It is anticipated that, upon completion of this course, students will be able to formulate models for simulating ignition and combustion problems in laminar flow conditions, solve certain types of models, and design laboratory experiments for some diagnostic measurements.

Students will be evaluated on the basis of class participation (5%), homework 20%), quizzes (5%), projects (25%), a mid-semester examination (20%) and a final examination (25%).

M E 531 will be offered each spring with an anticipated enrollment of 12 students; M E 532 will be offered each fall with an anticipated enrollment of 12.

Species Measurements in Combustion Systems (1-3)

General Education: None
Diversity: None
Bachelor of Arts: None
**M E 532 Turbulent and Two-Phase Combustion (3)**

Fundamentals of chemically reacting turbulent flows in homogeneous systems including turbulent flames, spray combustion, ignition, reacting boundary layers.

**M E 532 Turbulent and Two-Phase Combustion (3)**

M E 532 is the second course of two-course sequence. Continuing where M E 531 (Fundamentals of Combustion) left off, this course is devoted to the fundamentals of chemically reacting turbulent flows in both homogeneous and heterogeneous systems with special emphasis on turbulent flames in gases; heterogeneous combustion; chemical reactions in boundary-layer flows; spray combustion of liquid fuel droplets; two-phase combustion of solid particles; and, ignition of gaseous mixtures and condensed phases.

Upon completion of this course, students should be able to:
1) formulate a theoretical model to simulate a combustion problem, based upon knowledge of existing research.
2) identify the major mechanisms involved in a given combustion problem.
3) design a laboratory-scale test apparatus and test matrix to observe combustion phenomena and to take measurements.
4) interpret experimental results in terms of the trend of operating parameters.
5) validate the model using the experimental data and observations.
6) evaluate the merit of a model or experimental design presented in a technical article.
7) analyze realistic combustion problems using the basic principles of combustion and state-of-the-art technology.

Students will be evaluated on the basis of homework (20%), projects (25%), a mid-semester examination (25%), a final examination (25%), and class participation (5%).

M E 531 will be offered each spring with an anticipated enrollment of 12 students; M E 532 will be offered each fall with an anticipated enrollment of 12.

**M E 533 Solid Propellant Combustion (3)**

Introduction to phenomena of solid propellant combustion, analytical techniques for modeling propellant ignition and combustion behavior, experimental methods.

**Solid Propellant Combustion (3)**

General Education: None
Diversity: None

M E 546 (I E 546) Designing Product Families (3) Product families, product platforms, mass customization, product variety, modularity, commonality, robust design, product architectures.

M E (I E) 546 Designing Products Families (3)
Designing Product Families is a graduate-level course generally offered in the spring. It is designed for students interested in product realization, engineering design, and manufacturing to gain an understanding of mass customization and methods for designing families of products based on modular and scalable product platforms. The transition from craft production to mass production to mass customization will be covered in this course along with methods and tools for designing robust, modular, and scalable product platforms. Platform leveraging strategies and commonality metrics will be investigated through product dissection activities, which will also be integrated with lectures on evaluating manufacturing and assembly. Several industry case studies will also be discussed in the course to examine the implications of producing a variety of products and strategies for effective mass customization and product postponement.

Students interested in taking this course should be familiar with product design and manufacturing.

Students are evaluated through individual and group homework assignments, in-class participation and activities, and a group project report and presentation.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

M E 547 (EDSGN 547, I E 547) Designing for Human Variability (3) Statistics, optimization and robust design methodologies to design products and environments that are robust to variability in users.

M E 550 (E E 550) Foundations of Engineering Systems Analysis (3) Analytical methods are developed using the vector space approach for solving control and estimation problems; examples from different engineering applications.

Foundations of Engineering Systems Analysis (3)
This 3-credit course is offered at the first-year graduate level and provides a systems-theoretic background for more advanced graduate courses in the disciplines of engineering and science. The course uses the vector space approach to develop the analytical foundations for solutions of science and engineering problems in diverse application areas such as optimal control, estimation, and signal processing. First, the theoretical foundation of vector spaces, function spaces, and Hilbert spaces are developed. Linear transformations are then introduced, followed by the Reisz-Frechet theorem and Hahn-Banach theorem, with applications to optimization problems. Spectral analysis is then covered. Finally, diverse applications of these various techniques are presented throughout this course to illustrate the wide range of engineering problems that can be solved using the vector space approach.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

M E 554 Digital Process Control (3) Analysis and design of control systems with digital controllers, including PID, finite settling time, state feedback, and minimum variance algorithms.

Digital Process Control (3)
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

M E 555 Automatic Control Systems (3) Advanced problems and techniques in the design of automatic control systems with emphasis on stability, controller design, and optimum performance.

M E 560 (E MCH 500) Solid Mechanics (3) Introduction to continuum mechanics, variational methods, and finite element formulations; application to bars, beams, cylinders, disks, and plates.

M E (E MCH 500) 560 Solid Mechanics (3)

This course introduces students to the fundamental principles and basic methods used in solid mechanics. Using indicial notation and integral formulations provides a foundation for more advanced study in continuum mechanics (E MCH 540) and finite element analysis (E MCH 560) specifically and in mechanics in general. The materials behavior is restricted to linear elastic and the emphasis is on stress analysis. Students are expected to have an understanding of elementary mechanics of materials (such as E MCH 013).

The course objectives are to:
1) provide students with a firm foundation in solid mechanics.
2) introduce continuum mechanics concepts, variational methods, and the formulation used in finite element analysis.
3) enable students to formulate and solve the boundary value problems commonly encountered in the analysis of structures.

The study of solid mechanics starts with the definition of stress and strain and how the two are related by material law. Field equations that relate strain to displacement, ensure a single valued displacement field, and the balance momentum are formulated. These are partial differential equations that can only be solved subject to known boundary and initial conditions. The field equations and boundary conditions comprise a boundary value problem that is usually difficult to
solve exactly. Variational methods are used to bound or approximate the solution. The finite element method employs variational methods to formulate generic elements and is a computational tool for solving boundary value problems for complex geometries.

M E 561 Structural Optimization Using Variational and Numerical Methods (3)
Shape and size optimization of elastic structures, continuous and discrete solution methods and numerical algorithms, design of compliant mechanisms.

M E 561 Structural Optimization Using Variational and Numerical Methods (3)
Optimal Structural Design is a graduate-level course generally offered in spring semester. The course is designed for graduate students in mechanical engineering or related fields who have already taken a course in finite element analysis. The course covers techniques in structural optimization from classical variational-based methods to modern numerical and finite element-based methods. Topics include shape and size optimization of elastic structures, continuous and discrete methods for least weight maximum stiffness design, solution using optimality criteria methods, structural topology optimization, gradient-based solution methods and numerical algorithms, and design project(s) using these methods. Methods are applied to examples such as beam and truss structures, compliant mechanisms, and piezoelectric actuators.

Computer programming skills using software such as Matlab are required. Students are evaluated based on homework assignments, review and presentation of articles from the literature, class participation, and a group design project.

M E 573 (ACS 573) Designing Quiet Structures (3) Course integrates structural dynamics, acoustics and optimization into unified method for designing quiet structures virtually for early product development.

M E (ACS) 573 Designing Quiet Structures (3)

During the past decade, several Mechanical & Nuclear Engineering faculty have been developing a broadly applicable methodology for the acoustic design of structures. The method integrates the disciplines of structural dynamics, acoustics and optimization into a unified approach that allows designers the possibility of including sound as a parameter in the early stages of product development. This course is designed as an introduction to this unique design method.

The format of the teaching style is a series of modular lectures each supplemented with an experiment (either numerical or physical) that students perform in teams. Because of the multidisciplinary nature of the course, the composition of the teams is balanced to ensure that at least one team member has a solid background in one of the three disciplines to be covered.

All of the experiments center on the problem of controlling the sound power spectrum of a structure via material tailoring, e.g., adding trim elements such as mass, stiffness, damping or dynamic absorbers. In particular, each team is asked to modify the acoustic signature of a selected structure to minimize its sound power radiation within a given frequency band. Optimization search routines identify the optimal location and size of the trim elements to give the best fit to the prescribed objective function.

Dedicated computer programs are available to students enrolled in this course.

Students are evaluated through individual and group homework assignments, in-class participation and activities, and a group project report and presentation.

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

### Medical Triag&Resusc (MEDTR)

MEDTR 743 Triage and Resuscitation (5) This course provides knowledge and skills necessary for recognition and initial management of the patient with a potentially life-threatening illness or injury.

**Triage and Resuscitation (5)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2010
Prerequisite:

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

### Medicine-Hy (MED)

MED 700 Clinical Clerkship in Medicine (15) To provide supervised clinical experience in the management of patients with acute and chronic illness.

**Clinical Clerkship in Medicine (15)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Winter 1978
Prerequisite:
**MED 715 Clinical Elective in Infectious Disease (5-10)**
Principles of human-host defense mechanism, host-parasite interactions, manifestations of various infections, systematic approach to problem solving, rational use of antibiotics.

**Clinical Elective in Infectious Disease (5-10)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Winter 1978
Prerequisite:

**MED 721 Cardiology Elective for 3rd Year Students (5)**
Students learn non-invasive and invasive cardiology procedures, then work as clinical clerks on an in-patient cardiology service.

**Cardiology Elective for 3rd Year Students (5)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2010
Prerequisite:

**MED 722 Medicine Acting Internship (5)**
Active participation on an advanced level in the diagnosis and management of patients admitted to the General Internal Medicine Services. More responsibility for decision-making and patient management is afforded subinterns than clinical clerks.

**Medicine Acting Internship (5)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2009
Prerequisite:

**MED 723 Clinical Elective in Gastroenterology (5-15)**
A program in clinical gastroenterology to expose student to basic GI physiology, pathophysiology, and management of gastrointestinal and liver problems.

**Clinical Elective in Gastroenterology (5-15)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Winter 1978
Prerequisite:

**MED 724 Clinical Elective in Hematology (5-15)**
Provides students with the basic understanding of the fundamental problems of hematology.

**Clinical Elective in Hematology (5-15)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Winter 1978
Prerequisite:

**MED 725 Clinical Elective in Medical Oncology (5-15)**
Introduces students to cancer chemotherapy and immunotherapy with emphasis on workings of lymphoma and solid tumor patients.

**Clinical Elective in Medical Oncology (5-15)**

General Education: None
Diversity: None
MED 727 Elective in Pulmonary Medicine (5-15) A clinical program in pulmonary medicine with emphasis in pulmonary physiology, pathophysiology, and patient diagnosis and management.

MED 728 Clinical Program in Nephrology (5-10) Problems in clinical nephrology with emphasis placed on a pathophysiologic approach. Introduction to renal biopsy, peritoneal dialysis, and hemodialysis.

MED 733 Cardiology Acting Internship (5) Advanced training in cardiovascular pathophysiology and diseases for fourth-year students functioning as acting interns.

MED 734 Clinical Elective in Endocrinology (5-15) Expose students to a large number of clinical endocrine problems, familiarize them with diagnostic laboratory procedures used in evaluating patients.

MED 736 Clinical Management of Obesity (5) This course provides exposure to the multifaceted area of obesity management, including diabetes, bariatric surgery, medical management and pediatrics

MED (SURG) 736 Clinical Management of Obesity (5)

This course is designed to introduce 4th year students to a clinical approach to the co-morbidities associated with obesity and development of a treatment plan that incorporates a variety of treatment options (medical, surgical, pharmaceutical). Students will learn to counsel/motivate patients to make informed decisions consistent with adopting and maintaining a healthy lifestyle, including establishing appropriate dietary and exercise goals, and the behavioral skills to reach these goals.

Students will perform one patient encounter per clinic, where the student will be expected to perform a history and physical and design a plan specific for that patient. One of these sessions will be interchanged so the student will be able to observe one surgical procedure at Hershey Medical Center. Evaluation of patients will be augmented by Weight Management Program staff and will include interaction with clinical dietitians and the Department of Psychiatry staff to learn nutrition, physical activity, and behavioral skills. Students will be given an opportunity to perform body composition analysis. Students will be expected to demonstrate evidence of independent reading, and will complete a short review paper on an obesity related topic.
MED 738 Clinical Elective in Cardiology--Consultation Service (5) Students evaluate and follow in-patients on general non-cardiology services with cardiac problems referred to the Cardiology Consult Service.

MED 742A Allergy and Immunology Clinical Elective for 3rd Year Students (2.5) Allergy and Immunology Clinical Elective for 3rd year students.

MED 745 Geriatric Elective (5) Students will perform assessments and develop care plans for hospitalized elders who are transitioning to home or long-term care setting.

MED 747 Clinical Elective in Allergy, Asthma and Immunology (5) This course provides exposure to basic concepts for diagnosis and management of children and adults with allergic and immunologic diseases and respiratory and cutaneous abnormalities.
MED 748 Adult Rheumatology Elective (5) This course provides exposure to concepts utilized in the diagnosis and management of rheumatic diseases in adults.

MED 748 Adult Rheumatology Elective (5)
This course is designed to introduce fourth year medical students to the basics of evaluation and management of adults with musculoskeletal disease with an emphasis on diagnosis and treatment of inflammatory and non-inflammatory arthritis. This primarily outpatient experience will build on the concepts presented during the second year didactic course in MSK medicine that dealt with rheumatology topics as well as the Island I MSK portion which utilized physical diagnosis skills related to musculoskeletal joint evaluation. Students on this elective will serve as an integral part of the team and will be the first contact with returning and new patients in the outpatient clinic setting having had a chance to interact one on one with patients in order to practice history taking and exam skills. Students will then present the information to the attending physician where management and treatment options will be discussed. Pertinent physical exam and radiographic findings will be noted and technique for joint aspiration and injection will be demonstrated in the appropriate patients. Students will be expected to demonstrate evidence of independent reading on rheumatology topics and preparation of case based presentations for weekly conferences. Opportunities for interested students to participate in pediatric rheumatology clinics are also available during this time.

The overall goal of this elective is to allow students to attain the basic skills and knowledge necessary for the initial evaluation and diagnostic work up of common presenting musculoskeletal complaints in the primary care outpatient and in-patient settings. Emphasis will be placed on pathophysiology, differential diagnosis, physical exam findings and management options as well as the essential portions of the history and physical exam. Students will be encouraged to practice their musculoskeletal exam skills under supervision in order to become proficient by the end of the four week elective.

Evaluation methods will include a pre-test and post-test as well as subjective evaluation of students’ fund of knowledge and patient care skills by the attending rheumatology faculty. This course will be offered throughout the entire academic year.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2009
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MED 749 Medical Intensive Care Acting Internship (4th year) (5) Senior students assume Acting Intern responsibilities for Medical ICU level patients. This intense training is recommended for highly motivated students interested in a “hands-on” experience in the critical care unit.

Medical Intensive Care Acting Internship (4th year) (5)
General Education: None

Meteorology (METEO)

METEO 410 Advanced Topics in Weather Forecasting (3) Exploring highly specialized topics and techniques in weather
METEO 410 Advanced Topics in Weather Forecasting (3)

T.H. Huxley's passage from Biogenesis and Abiogenesis -- "The great tragedy of Science - the slaying of a beautiful hypothesis by an ugly fact" (1870) -- will serve as the springboard for learning in METEO 410. In the spirit of a "beautiful hypothesis," forecasters' diagnoses of the present state of the atmosphere and their prognoses for how the atmosphere will evolve with time may be scientifically sound. Yet, local weather can turn out dramatically different than the intent of the forecast (the ugly fact). To compound this "great tragedy of Science," weather forecasters routinely spend most of their preparation time on local details, particularly when the weather tends to get more interesting.

Nonetheless, there are "master forecasters" who regularly avoid great tragedies in weather forecasting. Master forecasters will prudently weigh the length of the forecast time as well as interactions between weather features on the hemispheric, synoptic, meso and local scales while, at the same time, they will adroitly use an array of forecasting tools to arrive at a high-quality local forecast. With the prudent and seasoned approach of the master forecaster in mind, METEO 410 will provide students with a master apprenticeship in weather forecasting. As master apprentices, students will learn highly specialized tools and techniques that will help them to hone and expand their overall forecasting skills.

For example, students will learn a new technique for forecasting rare and extreme weather that is based on assessing departures of specific meteorological fields from climatological norms. In the process, students will study rare historic events, such as the great ice storm across northern New England and eastern Canada in 1998. Along the way, students will learn some basic statistics, including climatological means and standard deviations.

As master apprentices, students will also learn about medium-range forecasting (three to seven days into the future) and medium-range computer models. Students will learn how to implement modern prediction techniques, such as ensemble forecasts from computer models. Master forecasters increasingly take advantage of this avant-garde technique in short to medium-range forecasting.

Unique learning modules, which run the gamut from forecasting wildfires to learning about the influence of the North Atlantic Oscillation on long-range forecasts (seven days or more), will provide students with the tools to understand the bases for all the forecasts they see on television, hear on the radio, read in publications such as Weatherwise, or access on the World Wide Web. For example, students will learn about the forecasting products issued by the Climate Prediction Center, which include seasonal outlooks that focus on the seasonal impacts of La Nina and El Nino.

To facilitate the learning objectives, METEO 410 will include the use of digital video, audio, simulation models, virtual field trips to on-line resources for weather data, text, and interactive quizzes that provide timely feedback.

It should be noted here that METEO 410 will be one of four courses required for students to earn a Certificate of Achievement in Weather Forecasting, a unique online program offered through Penn State's World Campus. The three other courses that will comprise this online program are METEO 101: Understanding Weather Forecasting, METEO 241: Fundamentals of Tropical Forecasting and METEO 361: Fundamentals of Mesoscale Weather Forecasting.

To demonstrate their mastery of the learning objectives, students will complete automated online quizzes, actively engage in online discussion groups focusing on real-time weather, and publish, to a personal "e-portfolio", four comprehensive projects that will explore timely case studies related to weather forecasting. The e-portfolio will take the form of a Web site that students initially create during the second course of the program (METEO 241 or METEO 361). Students will augment their e-portfolio as part of the requirements for METEO 241, METEO 361 and METEO 410. They will also use the space to reflect on their learning.

At the end of the program, students will make a final e-portfolio entry that highlights their program accomplishments. In this way, the e-portfolio will serve both as a showcase of a student's work for the purpose of course assessment and as a chronicle of a student's achievements during the program. By using their Penn State personal Web space to host their e-portfolios, students will be able to share their work not only with program faculty and students, but also with external audiences, including potential employers. Upon successful completion of the program, graduates will receive a copy of their final e-portfolio on CD-ROM.

Effective: Spring 2004
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 413 Map Analysis (3) Analysis of actual surface weather observations, with emphasis on the Norwegian cyclone
METEO 413 Map Analysis (3)

METEO 413, Map Analysis, is designed as a professional elective for Meteorology majors and as such it is primarily taken by fourth-year students. Third-year students who have completed METEO 411 may also register for Map Analysis. The course encourages students to tie together concepts learned in prior meteorology courses through analysis of numerous weather maps from across the northern hemisphere both at the surface and above. This is accomplished by improving the student's understanding of the cyclone model and applying that knowledge to "real-life" analyses where data quality may be compromised and topographic and other mesoscale factors may be important. Grades are based upon the best 13 of 14 lab assignments, 2 or more quizzes, and in-class assignments. Class participation is rewarded on an extra-credit basis. METEO 413 is offered each spring; enrollment is limited to 15 students.

METEO 419 Air Quality Forecasting (3) Issues relating to the prediction and dispersion of air pollutants as discussed.

METEO 419 Air Quality Forecasting (3)

Prediction of air quality is discussed from the perspective of operational weather forecasting. The chemical properties of pollutants for which public forecasts are currently made, fine-scale particulate matter and ozone, are summarized to

The Pennsylvania State University
provide the physical background for making forecasts. The impacts of weather on pollutant concentrations are discussed. Current techniques for forecasting air quality are presented and used by the students to create their own air quality forecasts. Students present air quality weather briefings and post-analysis of significant historical air quality events. To take this course, students must have the background provided in a basic course in chemistry and a basic course in meteorology that covers weather systems governing the transport of air pollution.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 421 Atmospheric Dynamics (4) Balanced and unbalanced flows, vorticity, circulation and potential vorticity, an introduction to wave dynamics and stability analysis, and a quantitative discussion of the general circulation.

Meteo 421 Atmospheric Dynamics (4)

This course builds on the foundation laid in METEO 300, Fundamentals of Atmospheric Science, by presenting applications of the equations of motion to the description of a variety of atmospheric motions. The dynamics of balanced flows (e.g., geostrophic winds) are reviewed and contrasted with unbalanced flows (e.g., inertial oscillations, isallobaric and convective isallobaric winds) that often help to maintain geostrophy (for examples, frontogenesis). The intrinsically rotational aspects of large-scale atmospheric motions are presented through a discussion of vorticity dynamics (including both relative and planetary vorticity) and the related circulation theorems of Kelvin and Bjerknes that culminate in potential vorticity thinking. An introduction to wave dynamics presents the perturbation method and the concepts of phase and group velocity with applications to gravity and Rossby waves, and to geostrophic adjustment. These techniques are then applied to the stability of convective, barotropic, and baroclinic motions. Finally, the general circulation (including zonally averaged circulation, longitudinally dependent features, the angular momentum budget, and the Lorenz energy cycle) is discussed quantitatively to provide a description of planetary-scale motions.

**METEO 434 Radar Meteorology (3)** Fundamental operating principles of radars, with application to observation of meteorological phenomena.

**METEO 434 Radar Meteorology (3)**

Students will learn the basic operation principles of weather radar as it affects the taking and interpreting of measurements of weather phenomena. To achieve this ability, students must master concepts of radar design and operation, electromagnetic propagation through and scattering by atmospheric constituents, and the characteristics of atmospheric scatterers. With these tools in hand, the class will focus on interpreting weather phenomena. One-third of each lecture will be dedicated to the discussion and interpretation of student-provided radar images. Students will actively participate in the class through bringing radar observations to class for discussion. They will be required to access data from the World Wide Web, organize it for a computer-based presentation, do an in-class presentation and lead the subsequent discussion. Students should have a basic background in electromagnetic theory, such as can be acquired in a physical meteorology course (METEO 437), as well as have either completed or be co-registered for a mesoscale meteorology class (METEO 414). Students will be evaluated based on class participation, homework and two exams.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2001
Prerequisite: METEO 414

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**METEO 436 Radiation and Climate (3)** Elements of earth-sun geometry, radiative transfer, photochemistry, remote sensing of the atmosphere, physical climatology, climate forcing.

**METEO 436 Radiation and Climate (3)**

This course covers radiation and how it interacts with the atmosphere and earth’s surface to drive motions in the atmosphere. The fundamentals of radiative transfer at the molecular level, including absorption, scattering, transmission, and emission of radiation by matter, are discussed and applied to help describe the earth’s energy budget. Crucial to understanding these processes in the atmosphere are the interactions of radiation with water in the vapor, liquid, and solid states. Applications of radiative transfer to the understanding of seasons and of climate and climate change are presented as well.

General Education: None

**METEO 440W Principles of Atmospheric Measurements (3)**

The standard theories and practices used in measurement and analysis of atmospheric variables are surveyed in the lecture portion of the course. The laboratory portion of the course provides students hands-on experience with using standard and self-produced instruments to make reliable measurements and with analyzing meteorological observations to determine their significance. In the laboratory reports, students learn the fundamentals of appropriate scientific writing.
to summarize the objectives of the lab exercise, to provide an analysis of the observations, and to critique the results. The initial drafts of these reports are evaluated critically by the instructors and teaching assistants and then are revised by the students based on these evaluations. Discussion of scientific writing and of proper report protocols are presented in the course as well.

Diversity: None
Bachelor of Arts: None
Effective: Fall 2010
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 446 Laboratory in Atmospheric Physics II (1) Experimental practices in cloud and aerosol physics, atmospheric electricity, atmospheric chemistry, radar meteorology.

Laboratory in Atmospheric Physics II (1)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1991
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 451 Introduction to Physical Oceanography (3) Air-sea interaction, wind-driven and thermohaline circulations, upwelling, El Nino, waves, and tides.

METEO 451 Elements of Physical Oceanography (3)

The primary objective of this course is to describe the circulation of the ocean and present a theoretical basis for understanding it. The focus is on the large-scale, basin-wide features of the ocean circulation, such as: 1) the subtropical ocean gyres that contain the wind-driven western boundary currents like the Gulf Stream, 2) the equatorial oceans that respond rapidly to external forcing to produce phenomena like El Nino, and 3) the thermohaline circulation that acts as a slow regulator of the earth’s climate. A main goal is to demonstrate to meteorology students that the ocean is not a static, passive lower boundary to the atmosphere but a dynamic, evolving entity that is intimately coupled to the atmosphere through the exchange of heat, momentum, and water. Thus the oceans affect weather and climate. Students are evaluated on their comprehension of the relevant physical processes (as determined by written examinations) and by term papers and laboratory reports or a combination of the two. This course will be offered annually with an enrollment of about 12 students.

Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2007
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 452 Tropical Meteorology (3) Atmospheric processes in the tropics; mass, heat, energy, momentum, and water vapor budgets, cumulus convection, hurricanes and other disturbances.

Tropical Meteorology (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 1983
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 454 Introduction to Micrometeorology (3) Physical processes and their measurement in the lowest layers of the atmosphere; application to hydrology, plant systems, and air pollution.

METEO 454 Introduction to Micrometeorology (3)

Students will learn the basic fluid mechanics and thermodynamics of the atmospheric boundary layer (ABL), the lowest few hundred meters to few kilometers of the atmosphere. Specific topics covered include:
1. Introduction to micrometeorology
2. The surface energy budget
3. Radiation balance near the surface
4. Soil heat transfer
5. Air temperature and humidity in the boundary layer
6. Wind distribution in the boundary layer
7. Introduction to viscous flows
8. Introduction to turbulence in the boundary layer
9. Semi-empirical theories of turbulence

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2009
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 455 Atmospheric Dispersion (3) The basic principles of atmospheric flow, introduction to the modeling of turbulent diffusion, and the use of EPA dispersion models.

METEO 455 Atmospheric Dispersion (3)
Students will learn both the theory and current practice of numerical modeling of the turbulent dispersion of effluents from sources in the atmospheric boundary layer. Lab sessions involve hands-on experience with the numerical models used in the applied dispersion community. Classroom sessions cover the boundary-layer meteorology and dispersion theory on which these models are based. In laboratory sessions, students become acquainted with the present practice of short-range atmospheric dispersion modeling through:
- exploring the air-quality resources available on the World Wide Web
- examining the design of the air-quality models used today in permitting and hazardous-release applications
- discussing the input data needed by the models, the nature and reliability of their predictions and the advantages of improved models including AERMOD
- running the models SCREEN3 and ISC (the U.S. EPA's Industrial Source Complex model).

Lectures on boundary-layer meteorology include:
- the atmospheric boundary layer, turbulence, and the surface energy budget
- buoyancy, stability and their influence on the atmospheric boundary layer
- mass conservation in fluid motion, turbulent and molecular fluxes and their roles in atmospheric dispersion
- the contrast between instantaneous and average properties of turbulent flow, the convergence of averages and implications for dispersion models

Bachelor of Arts: None
Effective: Spring 2011
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 460 Weather Risk and Financial Markets (3) This course will introduce the role that weather plays as a source of financial and operational risk for businesses, market and other institutions.

METEO 460 Weather Risk and Financial Markets (3)
The course introduces students to the role that weather plays as a source of financial and operational risk for business, markets, and other institutions. It also introduces the tools and concepts for weather risk management-the insurance products, financial instruments, and decision tools that organizations use to manage, reduce, and transfer their weather-related risks. Major topics include: (i) The concept of risk and the role of weather as a driver of economic risk; (ii) Probabilistic approaches to weather forecasting; (iii) Techniques for valuation of weather derivatives; (iv) Links between weather and markets for energy and agricultural commodities; and (v) Management of catastrophic hurricane risks. Weekly assignments culminate in a major student project on weather risk management.

Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

METEO 465 Middle Atmosphere Meteorology (3) A topical survey of physical, chemical, and dynamical processes at work in the stratosphere and mesosphere (middle atmosphere).

Middle Atmosphere Meteorology (3)
METEO 466 Planetary Atmospheres (3) A survey of planetary atmospheres and the chemical and physical processes by which they form and evolve.

Planetary Atmospheres (3)

METEO 469 From Meteorology to Mitigation: Understanding Global Warming (3) Introduction to global warming and climate change: the basic, science, projected impacts, and approaches to mitigation.

METEO 469 From Meteorology to Mitigation: Understanding Global Warming (3)

Human-caused climate change represents one of the great environmental challenges of our time. As it is inextricably linked with issues of energy policy, a familiarity with the fundamentals of climate change is therefore critical for those looking to careers in the energy field. To appreciate the societal, environmental, and economic implications of policies governing greenhouse gas emissions, one must further understand the basic underlying science. METEO 469 serves to lay down the fundamental scientific principles behind climate change and global warming. A firm grounding in the science is then used as a launching point for exploring issues involving climate change impacts and mitigation. METEO 469 will introduce students to the basic information necessary for understanding Earth’s climate, including the relevant atmospheric processes, and aspects of other key components of the climate system such as the cryosphere, hydrosphere, and biosphere. Students will learn how to do basic computations and to use theoretical models of the climate system of varying complexity to address questions regarding future climate change. Students, further, will explore the impacts of various alternative greenhouse gas emissions scenarios and investigate policies that would allow for appropriate stabilization of future greenhouse gas concentrations. The structure of the course roughly parallels the treatment of the subject matter by the reports of the Intergovernmental Panel on Climate Change (IPCC), focusing first on the basic science, then the future projections and their potential impacts, and finally issues involving adaptation, vulnerability, and mitigation. METEO 469 will combine digital video, audio, simulation models, virtual field trips to on-line data resources, text, and interactive quizzes that provide instantaneous feedback.

METEO 470 Climate Dynamics (3) The fundamental principles that govern Earth's climate and their relevance to past and future climate change.

METEO 470 Climate Dynamics (3)

Climate Dynamics delves into the fundamental processes that control the earth's climate of the past, present, and future. Fundamentals are developed from concepts of basic dynamic meteorology, radioactive transfer, and thermodynamics. Basic atmospheric radioactive transfer, the surface energy and hydrologic budgets, and the atmospheric and oceanic circulation are covered. A survey of the earth's climate through geologic history is also covered, including extinction events and the impacts on climate. The concepts developed in this course are applied to the topic of anthropogenic climate change and how various aspects of the system could be influenced by global warming.

METEO 471W Observing Meteorological Phenomena (3) Teaching the observational and interpretative skills needed to read the sky.

Observing Meteorological Phenomena (3)
METEO 473 Application of Computers to Meteorology (3) Application of statistical and numerical methods to practical problems in meteorology.

METEO 474 Computer Methods of Meteorological Analysis and Forecasting (3) Distribution of scalars and vectors; sampling; regression and correlation in two and three dimensions; time series, statistical forecasting; forecast verification.

METEO 477 Fundamentals of Remote Sensing Systems (3) The review of fundamental physical properties leads into discussions of various techniques, including imaging, spectroscopy, radiometry, and active sensing.

METEO 480M Undergraduate Research (3) A research thesis will be prepared. A written and oral presentation required.
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**METEO 480W** Undergraduate Research (3) A research thesis will be prepared. A written and oral presentation required.

Effective: Summer 2010

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**METEO 495A Meteorology Communications Internship (3 per semester/maximum of 6)** Internship focusing on communication of weather forecasts or other meteorological information.

A student participates for at least 100 hours in an internship with an agency or company that focuses on communication of weather forecasts or other meteorological information. This internship is normally completed after the junior year. Given the focus of this internship and the paper requirement to relate the internship experience to a 400-level meteorology course, students must have completed the required course on synoptic meteorology. After the internship has been completed, the student writes a paper based on the contract posted on the Department of Meteorology website. This paper normally is evaluated by the student’s Meteorology Department academic advisor. The course grade depends on this evaluation combined with the assessment provided to the advisor by the student’s internship supervisor.

General Education: None

**METEO 511 The Weather From Global to Micro Scales (3)** Conceptual models and underlying physics for weather phenomena on scales from the global general circulation to turbulence.

**METEO 511 The Weather From Global to Micro Scales (3)**

Earth's weather occurs on a variety of scales from the global general circulation down to microscale turbulence. This spectrum includes synoptic scale storms whose structure and dynamics vary with latitude and topography as well as a broad range of mesoscale phenomena whose structure depends strongly on the vertical structure of the atmosphere. At these intermediate scales, each phenomenon draws energy from conditions created by phenomena of both larger and smaller scale phenomena. Thus, the full spectrum of weather phenomena is linked energetically. This course explores these linkages and the dynamics of the weather phenomena that result. Quantitative results from this theoretical analysis are then used to explain the structure and behavior of the phenomena themselves. Using both theoretical and observational methods students will gain an understanding of the full spectrum of weather phenomena including the physics and dynamics responsible for their structure, development, and evolution.

**METEO 512 Topics in Synoptic Meteorology (3)** Application of atmospheric dynamics to the diagnosis and prediction of synoptic-scale weather.

**METEO 512 Synoptic Applications of Dynamic Meteorology (3)**

The primary objective of the course is to investigate midlatitude synoptic-scale weather systems from a quasigeostrophic perspective. Topics include Sutcliffe's development theorem, quasigeostropic height tendency and omega equations, midlatitude extratropical cyclones, fronts and frontogenesis, semigeostrophic theory, and the potential vorticity perspective of synoptic-scale analysis. The course builds upon the dynamical understanding acquired in atmospheric dynamics and synoptic courses, and is well-suited for students seeking careers in a broad range of areas, including but
not limited to air quality, weather forecasting and communications, microscale meteorology, mesoscale meteorology, and
synoptic meteorology.

**METEO 520 Geophysical Fluid Dynamics (3)**

This is a course in the fundamentals of fluid dynamics with an emphasis on basic concepts that are important for geophysical flows, such as those in the atmosphere and ocean. Topics include kinematics, conservation laws, vorticity dynamics, dynamic similarity, laminar flows, and an introduction to waves and instability. Students should leave this course with a solid foundation in fluid dynamics, possessing a conceptual and mathematically rigorous understanding of the fundamental conservation laws for fluids and some basic applications of them. Together, METEO 520 and METEO 521 (Dynamic Meteorology) make up the core dynamics curriculum for graduate students of meteorology.

METEO 591 Development and Ethics in the Atmospheric Sciences (1) Provide a forum for discussion of scholarship and research integrity as well as critical components of professional development.

METEO 591 Development and Ethics in the Atmospheric Sciences (1)

This course provides a forum with graduate faculty for discussions on responsible conduct of research topics relevant to the atmospheric sciences, including, but not limited to: acquisition, management, sharing, and ownership of data; publication practices and responsible authorship; conflict of interest and commitment; research misconduct; peer review; mentor/trainee responsibilities; collaborative science. Important components to successful professional development of students are also considered.

METEO 801 Understanding Weather Forecasting for Educators (3)

Never before has the quantity of available weather information so far exceeded the quality of the public’s understanding of atmospheric science. METEO 801 aims to help correct this imbalance by helping secondary teachers to develop the knowledge and skills they need to become critical consumers of weather information, and in turn, help their own students to do the same. Students who successfully complete METEO 801 will be able to apply knowledge of fundamental concepts of atmospheric science to discriminate between reliable and unreliable weather forecasts, to explain what makes one forecast better than another, and to teach these same concepts and applications to secondary school students.

To ensure that students develop the knowledge and skills required to critically assess public weather forecasts, METEO 801 will provide an apprentice-training environment that will encourage students to learn forecast mid-latitude weather themselves. They will discover that weather forecasting involves sophisticated data analysis techniques, a thorough understanding of atmospheric science, and strong verbal and graphic communication skills.

METEO 801 will combine digital video, audio, simulation models, virtual field trips to on-line weather data resources, text, and interactive quizzes that provide instantaneous feedback. The course will provide unprecedented access to one of the world’s most distinguished meteorology programs. METEO 801 students will be granted licenses to use the courseware developed for this course in their own secondary classrooms.

The overarching goal of the course is to help secondary science teachers become informed, critical consumers of the weather information they rely upon every day and to be able to effectively convey their knowledge to their students as part of an Earth science curriculum.

Students will be required to complete weekly assignments. There are 12 lessons in METEO 801. Each lesson contains interactive exercises, links, animations, movies, and novel explanations of the basic scientific principles of how the atmosphere works. At the end of each lesson, students will take an open-book “Promotion Quiz” that allows them to improve their status as an apprentice forecaster.

In addition to Promotion Quizzes and weekly assignments on the course discussion board, students will be assigned four projects throughout the semester. Projects are also open book but require you to apply the principles students have learned to past case studies of storms and specific weather patterns.

METEO 802 Fundamentals of Tropical Forecasting for Educators (3) Applying atmospheric principles to the tropics, with an emphasis on the development, structure, prediction, and destructive impact of hurricanes.

METEO 802 Fundamentals of Tropical Forecasting for Educators (3)

Worldwide, approximately 80 tropical cyclones develop each year. This global annual average of tropical cyclones is small in comparison to the thousands of low-pressure systems that routinely parade across the middle latitudes each year. Yet tropical storms and hurricanes garner far greater attention from meteorologists and the media. The obvious reason for this lopsided focus is that tropical cyclones can inflict great devastation to life and property.

To ensure that students develop the knowledge and skills required to critically assess weather forecasts issues by the National Hurricane Center, METEO 802 provides, like METEO 801, an apprentice-training environment. Under the tutelage of professional weather forecasters, students, in their role as apprentices, work toward the goal of creating their own tropical-weather forecasts.

In the process, students in METEO 802 learn about the pitfalls of forecasting the tracks and intensities of tropical storms and hurricanes as they actively work with output from sophisticated numerical models available on the Internet. Moreover, successful students apply their knowledge of the fundamental concepts of atmospheric science in order to competently evaluate forecasts issues by the National Hurricane Center in Miami and the Joint Typhoon Warning Center in Honolulu.

Students also gain a broad perspective of the general weather and oceanic patterns in the tropics. For example, students learn about El Nino and La Nina. In the process, they discover the El Nino and La Nina are not to blame for every unusual weather even that occurs anywhere in the world.

To facilitate the learning objectives, METEO 802 includes the use of digital video, audio, simulation models, virtual field trips to on-line resources for weather data, text, and interactive quizzes that provide timely feedback. The course will provide unprecedented access to one of the world’s most distinguished meteorology programs. METEO 802 students will be granted licenses to use the courseware developed for this course in their own secondary classrooms.

One of the primary objectives of METEO 802 is to give secondary science teachers a working knowledge of hurricanes and tropical storms so that they can become critical weather consumers and to be able to effectively convey their knowledge to their students as part of an Earth science curriculum.

Students will be required to complete weekly assignments. There are 12 lessons in METEO 802. Each lesson contains interactive exercises, links, animations, movies, and novel explanations of the basic scientific principles of how the
To demonstrate their mastery of the learning objectives, students complete automated online quizzes actively engage in online discussion groups focusing on real-time weather, and publish, to a person "e-portfolio," three comprehensive projects that explore timely case studies related to weather forecasting. The e-portfolio takes the form of a Web site. In addition to posting their work to their e-portfolio, students also use the space to reflect on their learning. By using their Penn State personal Web space to host their e-portfolios, students are able to share their work not only with program faculty and students, but also with external audiences, including potential employers.

METEO 803 Fundamentals of Mesoscale Weather Forecasting for Educators (3)

When outbreaks of severe weather occur, dire warnings for tornadoes, large hail or damaging straight-line winds urgently scroll across the bottoms of television screens. Simultaneously, television weathercaster’s warn viewers to “take cover immediately.” Yet, because of the limited spatial and time scales of severe thunderstorms, the areas affected by tornadogenesis and large hail and damaging straight-line winds often turns out to be relatively small (sometimes as small as a tenth of one percent of the original "watch area"). There is no doubt that people should be prepared to take definitive action to protect their lives and the lives of their families when outbreaks of severe weather occur. But the overall impression that entire counties or cities will be destroyed by severe weather can be, and frequently is, misleading.

To ensure that students develop the knowledge and skills required to critically assess public weather forecasts, METEO 803 provides an apprentice training environment that guides students, under the tutelage of professional weather forecasters, to actively learn how to create their own mesoscale-weather forecasts. In the process, METEO 803 reinforces the notion that weather forecasting involves sophisticated techniques of data analysis and a thorough understanding of atmospheric science. METEO 803 also stresses that the clear communication of the forecast requires strong verbal and graphic communication skills.

Using conceptual models and real-time radar and satellite imagery in concert with output from numerical models designed specifically for mesoscale forecasting, students predict severe weather on time scales of a few hours to one day. For example, students are required to choose a tornado “watch-box” issued by the Storm Prediction Center (SPC) in Norman, Oklahoma, and then to evaluate the forecast (and forecast verification) in the setting of a litany of scientifically sophisticated tools on SPC’s Web site. In effect, students will mirror the process that professional forecasters follow to create such high-profile forecasts. For more general outlooks that identify regions where there is a potential for severe weather (time scales of one to two days), students will use output from the numerical models that were introduced in METEO 801 to identify the areas likely to be at risk for severe weather.

To facilitate the learning objectives, METEO 803 includes the use of digital video, audio, simulation models, virtual field trips to on-line resources for weather data, text, and interactive quizzes that provide timely feedback. The course will provide unprecedented access to one of the world’s most distinguished meteorology programs. METEO 803 students will be granted licenses to use the courseware developed for this course in their own secondary classrooms.

One of the primary goals of METEO 803 is to give secondary science teachers a scientifically grounded perspective of the spatial and time scales of typical outbreaks of severe weather and other events associated with mesoscale weather systems. In the process, students become better weather consumers and to be able to effectively convey their knowledge to their students as part of an Earth science curriculum. To gain such insights, students learn conceptual models of the life cycles of severe thunderstorms and then apply them in real-time outbreaks of severe weather. In the final analysis, students are able to more accurately weigh the information being disseminated by the media and the Storm Prediction Center in Norman, Oklahoma.

Students will be required to complete weekly assignments. There are 8 lessons in METEO 803. Each lesson contains interactive exercises, links, animations, movies, and novel explanations of the basic scientific principles of how the atmosphere works.

To demonstrate their mastery of the learning objectives, students complete automated online quizzes, actively engage in online discussion groups focusing on real-time weather, and publish, to a personal “e-portfolio,” three comprehensive projects that explore timely case studies related to mesoscale weather forecasting. The e-portfolio takes the form of a Web site. In addition to posting their work to their e-portfolio, students also use the space to reflect on their learning. By using their Penn State personal Web space to host their e-portfolios, students are able to share their work not only with program faculty and students, but also with external audiences, including potential employers.

METEO 804 Special Topics in Weather Forecasting for Educators (3)
Exploring specialized weather forecasting topics and techniques spanning from mesoscale to planetary spatial scales and short-term to long-range time scales.

METEO 804 Special Topics in Weather Forecasting for Educators (3)

T.J. Huxley’s passage from Biogenesis and Abiogenesis -- "The great tragedy of Science - the slaying of a beautiful hypothesis by an ugly fact" (1870) -- will serve as the springboard for learning in METEO 804. In the spirit of a "beautiful hypothesis," forecasters’ diagnoses of the present state of the atmosphere and their prognoses for how the atmosphere will evolve with time may be scientifically sound. Yet, local weather can turn out dramatically different than the intent of the forecast (the ugly fact). To compound this "great tragedy of Science," weather forecasters routinely spend most of their preparation time on local details, particularly when the weather tends to get more interesting.

Nonetheless, there are "master forecasters" who regularly avoid great tragedies in weather forecasting. Master forecasters will prudently weigh the length of the forecast time, as well as interactions between weather features on the hemispheric, synoptic, meso and local scales, while, at the same time, they will adroitly use an array of forecasting tools to arrive at a high-quality local forecast. With the prudent and seasoned approach of the master forecaster in mind, METEO 804 will provide students with a master apprenticeship in weather forecasting. As master apprentices, students will learn highly specialized tools and techniques that will help them to hone and expand their overall forecasting skills. METEO 804 marks a dramatic shift in paradigm from the more traditional approach used in METEO 801, 802, and 803. Indeed, this course is, for all practical purposes, the "real deal" with regard to applying one's forecasting skills.

A major component of METEO 804 requires students to participate in the national forecasting content run by the University of Oklahoma, which will enable them to apply their meteorological knowledge to real-life situations. Over the course of the 10 week contest, students will compose and submit short-range, deterministic forecasts for selected cities across the United States (two cities per week). As a result, the instructors will only offer a modicum of new material at the beginning of the course, with Lessons 1 and 2 serving to bolster students’ forecasting skills before the national forecasting contest begins a few weeks into the course. This will require students to spend most of their course time communicating on the discussion boards with fellow classmates, formulating strategies, and identifying keys to each forecast. Once the forecasting contest begins, the only new material presented to students will be situational, i.e., if there's a twist to the forecast, the instructors will write-up a brief vignette that will serve to help students better understand that situation.

To facilitate the learning objectives, METEO 804 includes that use of digital video, audio, simulation models, virtual field trips to on-line resources for weather data, and text - all on an "as-needed" basis, in line with the needs that arise through the national forecasting contest. The course will provide unprecedented access to one of the world's most distinguished meteorology programs. METEO 804 students will be granted licenses to use the courseware developed for this course in their own secondary classrooms.

The overarching goal of METEO 804 is for students to "learn by doing". In other words, a large component of the course serves as a practicum that provides students the opportunity to forecast for five specific cities across the United States. These forecasting exercises will take place in the setting of a competition between students and professors from universities across the nation. Invariably, students will make errors in their forecasts (the very nature of weather forecasting). By keeping a log that documents their rationale for the details of their forecasts, students, after conducting "post mortems" (post analysis and verification), will examine and critique their forecasting approach. In the process, they will discover "lessons learned" that they will then document in their e-portfolios. In this way, students will sharpen their forecasting skills and solidify the underpinning scientific concepts. This strategy of "learning by doing" will make students more competent weather forecasters and more discriminating consumers of weather information, which they will then be able to translate to classroom activities in the courses they teach.

Students will be required to complete daily and weekly assignments. The primary activity for METEO 804 is participation in the national forecasting contest (WXChallenge) that runs for ten weeks during the semester. The contest requires students to test their forecasting skills at five selected cities (two weeks per city). For each week during the contest, students are required to electronically submit forecasts on four days (Monday through Thursday). Each day requires them to predict the high and low temperatures, total liquid precipitation, and the maximum sustained wind speed at the current contest city.

Four e-portfolio assignments are also required in METEO 804.

* The first e-portfolio assignment will require students to document their "lesson learned" during a practice week at the first city in the national contest.
* The second e-portfolio assignment requires students to write-up their "lessons learned" (analyses, scientific insights, observations and reflections on their forecasts) for the first two contest cities (four weeks of the national forecasting contest).
* Similarly, the third e-portfolio assignment requires students to write-up their "lessons learned" (analyses, scientific insights, observations and reflections on their forecasts) for the last three contest cities (six weeks of the national forecasting contest).
* The fourth e-portfolio assignment will require students to create a capstone project that utilizes the skills and knowledge they developed in METEO 804. This capstone project takes the form of a learning module that they, in turn, will be able to use to teach course concepts to their own secondary school students.

**MICRO 553** Science of Virology (4) Replication of viruses and effects on host cells, including oncogenic properties of viruses and cellular growth and survival pathways disrupted.

**MICRO (CMBIO) 553 Science of Virology (3)**

The objective of the Science of Virology course is to describe at the molecular level the replication strategies of representative DNA and RNA viruses and the effects of virus infection on cell growth control and survival. Emphasis is placed on developing an understanding of the experimental systems used to elucidate individual steps in virus life cycles and their interactions with host cells. Host cell-virus interactions leading to production of progeny virus and interactions involved in establishing and maintaining long term interactions, such as latency and oncogenesis, are discussed in detail. Reading from primary literature sources is an integral component of the course. Evaluation is by written examination. The examination format centers on problem solving and synthesis. The course is offered yearly and open to all students who have fulfilled the prerequisite.

**MICRO 554** Principles of Immunology (2) Study of immune response. Nature of antigens, structure, function of antibodies, hypersensitivity, transplantation and tumor immunology, autoimmunity, and immunosuppression.

**Principles of Immunology (2)**

General Education: None
**MICRO 560 Concepts in Immunology (4)**
Selected lectures/readings in advanced immunological concepts; emphasis on lymphocyte function and applications to anti-viral/tumor immunity.

Concepts in Immunology is an advanced course in immunology that is designed to instruct students in immunological topics that are typically not covered in depth in lower-level classes in microbiology and/or immunology. These topics usually represent emerging areas in immunology and/or the specific interests of the teaching faculty and/or students registered for the course. This course is team taught and is offered primarily to graduate students. Most students enrolled in this course are either graduate students in Graduate Programs in Microbiology and Immunology or students in other graduate programs but who are conducting thesis research in laboratories of faculty who are in the Department of Microbiology and Immunology. One major objective of this course is to reinforce the students’ knowledge in the fundamentals of immunology and to provide a substantially deeper base of knowledge in selected fundamental areas. Another major objective is to broaden the students’ scope of immunological concepts through the teaching of interdisciplinary topics in immunology. In the past, such topics have included neuroimmunology, immunological aspects of aging, immunology of atherosclerosis, regulation of the maternal immune response during pregnancy, and pathogenesis of rheumatoid arthritis. Achieving these objectives is accomplished though a combination of didactic lectures and readings/discussion of both primary and review literature. Student performance is evaluated on the basis of their performance on mid-term and final examinations. Final grades are also based on a written paper and oral presentation of the student’s choice. This course is typically offered in the Spring semester of each year and class enrollment usually ranges between four and ten students.

**MICRO 572 Literature Reports (1 per semester)**
Weekly analysis of current literature in microbiology.

**MICRO 581 Immunology A: Basic Concepts in Innate and Adaptive Immunity (1)**
Discuss innate immune mechanisms and the basic concepts and molecular/cellular components of adaptive immune system.

This course will cover basic concepts, molecular/cellular components, and recognition mechanisms of innate immune system. It will also include an introduction of the molecular/cellular components of the adaptive immune system. Lectures are based on research literature, although an Immunology textbook will be recommended to the students.

**MICRO 582 Immunology B: Adaptive Immunity (1)**
Discuss adaptive immune mechanisms.

This course focuses on the mechanisms in the development, activation, and effector functions of the adaptive immune system. It covers the development and activation of lymphocytes, humoral and cellular immunity, cytokines, as well as immunological techniques.
MICRO 583 Viral Vectors (1) Use and design of viral vectors in research and use in gene therapy; exploration of viral vector strengths and limitations.

This course is designed to provide the student with the "big picture" regarding the properties, design, and use of viral vectors within the research laboratory. A basic understanding on the construction of viral vectors, the various methods used for transfection, choice of promoters, as well as considerations regarding Kozak's rules, distance requirements between the 5'-end and the ATG, internal initiation sites, splicing signals, nuclear export signals, polyadenylation etc. In addition, emphasis will also be placed on the future role viral vectors will play in gene therapy and vaccination. One of the strengths of this course is that it will address a subject in translational medicine that is rapidly evolving and the students will be exposed to the dynamic aspects regarding the development of viral vectors for their eventual use in treatment of disease.

MN PR 426 (MATSE 426)  Aqueous Processing (3)  A study of the chemical and engineering principles pertinent to metal processing in aqueous systems: hydrometallurgical extraction, plating, materials preparation.

MN PR (MATSE) 426 Aqueous Processing (3)

This 3-credit course deals with the chemical and engineering principles underlying the aqueous processing of metals: metal extraction from primary and secondary sources, electroplating, and metal finishing, powder synthesis, energy storage and conversion, and treatment of recycling of metal-containing toxic wastes.

1. Physico-Chemical Principles - Thermodynamic, chemical kinetic and transport factors which control hydrochemical processes (leaching; precipitation; adsorption; solvent extraction; ion exchange; electrowinning, electrorefining and electroplating; membrane processes; energy storage and conversion); graphical representation of homogeneous and solid/solution equilibria; chemical reagents.

2. Engineering Principles - Reactor design and staged operations; ideal batch, continuous stirred-tank and plug-flow reactors; fluidized bed reactors; electrochemical reactors; multistage separation processes (solid-liquid, liquid-liquid, and gas-liquid systems).

3. Process Synthesis - Design of metal separation (extraction, refining, waste treatment) materials synthesis, metal finishing, and energy storage/conversion processes and system-integration of unit operations, industrial practice. Emphasis on closing circuits to minimize or eliminate waste effluents.

MN PR 505  Physical Separations in Mineral Processing (3)  Intensive study of theory and applications of gravity, magnetic, electrostatic, centrifugal, and other methods of mineral processing.

Physical Separations in Mineral Processing (3)

General Education: None
Diversity: None
M N P R 507 (MATSE 560) Hydrometallurgical Processing (3) Fundamental physico-chemical factors underlying the aqueous extraction and recovery of metals and nonmetals from ores, minerals, and scrap metal.

This 3-credit course is concerned with the fundamental physico-chemical processes associated with the processing, utilization, and recycling of materials in aqueous systems. The topics covered cut across a wide range of practical applications. The course is therefore suitable for a broad spectrum of scientists and engineers concerned with processes and processing in aqueous systems, e.g., in materials science and engineering, mineral processing, geoscience, soil science, environmental engineering, chemistry, chemical engineering, petroleum and natural gas engineering, mining engineering, nuclear engineering, and electronic and electrical engineering. A required term paper provides a formal mechanism for ensuring that students have the opportunity to apply ideas discussed in the course to their specific areas of interest.

M N P R 590 Colloquium (1-3) Continuing seminars which consist of a series of individual lectures by faculty, students, or outside speakers.

M N P R 596 Individual Studies (1-9) Creative projects, including nonthesis research, which are supervised on an individual basis and which fall outside the scope of formal courses.

**Mining (MNG)**

**MNG 401** Introduction to Mining Operations (1) An introduction to underground and surface mining methods; selection of extraction equipment; relevant auxiliary operations. Not intended for Mining Engineering majors.

**Introduction to Mining Operations (1)**
MNG 404 Mine Materials Handling Systems (2) Analysis and design of materials-handling systems in mining, such as belt conveyors, locomotives, and hoisting.

MNG 410 Underground Mining (3) Underground mine design; extraction techniques; description of auxiliary operations as they relate to the mining methods.

The purpose of this course is to describe the logic and discuss the steps taken in the planning and design of an underground mine. Since every underground mine incorporates a unique combination of technological, economic, legal, social, and environmental factors, the course will stress the auxiliary operations (ventilation, ground control, etc.) which must be accommodated, as well as the unit operations and equipment dealing with resource extraction.

MNG 411 Mine Systems Engineering (2) Applied operations research and systems methods for decision making in mine operations; time and systems studies to improve productivity.

MNG 412 Mineral Property Evaluation (3) Ore reserve estimation using statistics and geostatistics, mine cost estimation, engineering economy concepts applied to mineral deposits.

MNG 422 Mine Ventilation and Air Conditioning (3) Quality, quantity, and temperature-humidity control of the mine atmosphere; general mine environmental control.

The Pennsylvania State University
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MNG 441 Surface Mining Systems and Design (3) Design of surface mining for noncoal and coal minerals; emphasis on quarry and strip mining planning parameters: unit operations, systems, haulroads, draglines, spoil stability, reclamation, legal requirements, and health and safety.

MNG 451W Mining Engineering Project (1-5) Independent and integrative design and report of specific mine evaluation, layout, equipment selection, environmental control, permitting, and financial analysis.

Mining Engineering Project (1-5)

MNG 460 Mine Maintenance Engineering (3) Mine maintenance system design; maintenance planning and management; safety and cost analysis of maintenance programs.

MNG 470 Mining and Geologic Structures (3) Study of geologic structures and their impacts on mining operations.

The objective of this course is to introduce students to geologic structures that can impact mining operations and how to represent them for mine planning. A fundamental understanding of geologic processes that lead to various structures is covered.

MNG 470 Mining and Geologic Structures (3)

The Pennsylvania State University
of operating systems related to mills and mines.

**MNG (EME/F SC/P N G) 590 Colloquium (1-3)**

The objective of the course is to expose students through a seminar format to a wide range of topics on energy and mineral engineering. The lectures would be presented by faculty, students and guest speakers. Students would be required to write a short summary of each presentation and provide a critique of the presentation. Seminar topics will cover aspects of energy production, processing, utilization, and conservation, and the associated environmental, health and safety, and policy, economics, and management issues. Students are expected to keep up with current developments on each topic and to actively participate in the discussions. Students will be evaluated based on their class participation, and written summary and critique of each presentation. This is a required course in the energy and mineral engineering graduate program.

Mstr Law Courses (LLMLW)

LLMLW 900 Introduction to U.S. Legal Systems (2) To develop a good foundation for the LL.M. student's other course work, this course introduces the United States court system, the role of the Constitution in the United States legal system, and other foundation materials in United States law. The goal is to introduce students to distinctive aspects and/or fundamental principles in U.S. law. Enrollment in this course is limited to LL.M. candidates.

Introduction to U.S. Legal Systems (2)

General Education: None
LLMLW 901 LLM Legal Analysis, Writing and Research (2) This course explores U.S. common law analytic methods and discourse. Students will analyze cases and statutes to solve client problems. Students will draft objective memoranda and other documents to communicate their legal analysis in writing. Students will also learn the basics of U.S. legal research.

LLMLW 902 Advanced LLM Legal Analysis Writing & Research (2) Building on the LL.M. Legal Analysis, Writing and Research course, students will develop common law communication and research skills in the persuasive writing/advocacy context. Students will also develop effective client letter writing skills in a U.S. legal setting. The final portion of the course will contract drafting.

LLMLW 903 Introduction to Common Law Analysis and Language (2) This course introduces students to fundamental concepts of U.S. common law analysis and methods. The course will explore the role cases play within a common law system, including how they interact with other sources of law, as well as the methods common law lawyers use to analyze cases. Students will apply this knowledge to solve real legal problems while at the same time building language skills for clear legal communications.

LLMLW 904 US Common Law Methods (2-4) The course is for LL.M. students who speak English as a second language. It serves as a companion to a substantive law course, e.g., Constitutional Law I. Students will build skills in analyzing cases, applying case holdings to hypothetical facts and understanding the material presented in the substantive law course. Also, students will learn and practice skills necessary for success in law school, e.g., preparation of effective case briefs, class notes, and course outlines.

LLMLW 905 LL.M. Scholarly Writing Workshop (1) This course provides LL.M. students with the framework for developing a thesis, conducting research and producing a significant scholarly paper. In an interactive workshop setting, students will discuss progress, and receive feedback from faculty and fellow students on: (1) identification and refinement of a thesis; (2) developing and implementing a research plan; (3) appropriate use of authority, including legal citation form; (4) developing and refining a critical perspective and scholarly argument. Exemplary papers selected by faculty may be published in the law school's digital repository.
LL.M. Scholarly Writing Workshop (1)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2013

Concurrent: LL.M. students must be concurrently enrolled in a Penn State Law Seminar (SEM) course or an independent study (PERSP 996) of at least two credits with a law faculty supervisor.

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

LLMLW 906 U.S. Constitutional Law and Analysis (3) This course will examine the roles of the U.S. executive, legislative and judicial branches in determining the limits of individual and civil rights under the U.S. Constitution. It will also introduce LLM-level international students to analytical methods commonly used by U.S. lawyers with a focus on U.S. constitutional law. The goals of the course are to introduce students to U.S. constitutional law and to provide them with the analytical and English language skills necessary to succeed in a U.S. law school.

LLMLW 997A Foundations of Business Law (2) This course explores the sources and core concepts of U.S. business and commercial law including the common law of contractual obligation, sale of goods and payment systems under the Uniform Commercial Code, business entity law, and an introduction to international business transactions. It also considers how lawyers facilitate business transactions and add value to their clients' business operations. Students will read and discuss cases and statutes, and will practice negotiating business disputes and drafting agreements.

Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

LLMLW 997B Introduction to U.S. Common Law and Language (2) This course introduces students to the U.S. legal system. Students will learn to read and analyze U.S. cases, statutes, regulations, and constitutional provisions within the context of the common law system. Finally, students will use these analytical skills to write and speak about their legal analysis in English. Even for American students, the language of law is challenging. Participants will become immersed in
listening, reading, speaking, and writing English. Participants will spend time in class and in tutorials with linguistic experts and will be expected to spend evening hours reading, writing, and on group assignments.

**LLMLW 997C Contracts and Arbitration (2)**  
This course provides an introduction to the elements of contract formation in the American common law. It also addresses the problems associated to the creation of unilateral contracts, in particular, the integration of arbitral clauses and class action waivers in consumer contracts. The incorporation of these provisions raises a problem of enforceability. The course then considers the latest U.S. Supreme Court opinions on the topic of arbitration in these types of contracts. Students, then, will be asked to make an oral presentation defending both sides of the issue.

**MUSIC 420 Song Writing and Recording (3)**

This course will take the student through the process of composing and producing a recorded song. The class will consist of a combination of class meetings and individual instruction. Topics will include form, lyric writing, arranging, audio/MIDI recording and sequencing. Familiarity with basic audio sequencing software and music theory concepts is essential. The focus of the class is vernacular song as opposed to classical art song, but all the basic concepts discussed in the class apply to either genre. The course requires the composition of original songs and the creation of high-quality recordings of them and their conversion to MP3 format. The student are expected to enter the class with a basic knowledge of digital audio and MIDI (MUSIC/INART 258 or equivalent).

**MUSIC 424 Piano Pedagogy II (2)** Analysis of techniques of teaching intermediate-early advanced level piano and studies of music literature and pedagogical writings.

**Piano Pedagogy II (2)**

General Education: None  
Diversity: None  
Bachelor of Arts: Arts  
Effective: Spring 1997  
Prerequisite:

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MUSIC 425 Advanced Voice Pedagogy (2)** Analysis of techniques of teaching voice, supervised teaching, studies of studio materials and related topics.

**Advanced Voice Pedagogy (2)**
MUSIC 429 Aural Review for Graduate Students (1) An intensive review of the aural skills required for a theoretical understanding of 18th- and 19th-century music.

MUSIC 431 ADVANCED TONAL ANALYSIS (2-3) Advanced techniques of musical analysis.

MUSIC 432 Graduate Review of Twentieth-Century Analysis (2-3) The theory and analysis of style in music of the twentieth century.

MUSIC 433 Advanced Analysis of Twentieth Century Music (2-3) In-depth studies of selected twentieth-century repertoires and/or analytical models.

MUSIC 435 Score Reading (1) Introduction in score reading at the keyboard.

MUSIC 441W Emphasis in Elementary General and Choral Music (3) Selection and application of materials, methods, teaching and assessment strategies for elementary general and choral music settings.
MUSIC 441W Capstone Experiences in Elementary General and Choral Music (3)

This course is intended for Music Education majors in their senior year who have particular interest in working with elementary school children in a general music or choral setting. Students will apply all previous Music Education course work to this teaching setting. They will learn how to construct a course of study, including assessment strategies. Students will then apply that course of study by working with one elementary music class in the local schools. Teacher delivery issues, reflective practice, and assessment of student achievement will become a major component of this experience. A review of traditional approaches to elementary music teaching will also be presented and critically discussed. In addition, students will prepare two drafts of a philosophical statement justifying the inclusion of music in every child's curriculum as well as four drafts of a paper reviewing and summarizing articles on a topic of interest related to elementary music teaching.

General Education: None

Bachelor of Arts: None
Effective: Spring 2011
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MUSIC 442W Emphasis in Secondary General Music (3)

MUSIC 442W is offered to students who have been accepted into the Teacher Certification program in Music Education. The focus of this course is to provide students with opportunity to explore secondary general music settings under the close supervision of a faculty member. Topics include: the design and implementation of curriculum in secondary general music, the leading and teaching of songs in these settings, and specific grade-level appropriate pedagogy. The instructional format includes: lecture, small group discussion, readings, musical and teaching examples, and off campus observation and teaching in middle and high school classrooms. Students complete several practical assignments including off campus observations, presentation of the summations of small group discussions, curriculum planning and models, and teaching within public schools in grades 5-12. This is a writing intensive course with focus on a detailed, multi-drafted topic paper relating to specific elements of teaching choral and general music at the secondary level.

Bachelor of Arts: Arts
Effective: Fall 2013
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

MUSIC 444W Emphasis in Elementary and Intermediate Band (3) Examination and application of teaching strategies and materials for students planning to teach band in the elementary and middle schools.

MUSIC 444W Capstone Experiences in Elementary and Intermediate Band (3)

This course is intended to prepare pre-service teachers to teach beginning through intermediate instrumental (band) music. Preparation will include observation of current public school teachers and teaching technique4s and methods, preparation and implementation of appropriate lessons including assessments, in-depth analysis (case study) of a student currently in the public schools, development of a written philosophy of music education and band instruction, and consideration of practical matters associated with teaching in the public schools such as scheduling, recruitment and parent interaction.

The course serves as a capstone to the prior courses in the music education curriculum. Previous courses in instructional planning, instructional materials, instrument techniques, conducting piano and voice use will have developed necessary prior skills. Skills and concepts from these classes will be applied in this authentic context in the collegiate and public school classrooms.

The course will be assessed according to their effectiveness in observation, teaching preparation, teaching and research. Evaluation will be in the form of written and verbal feedback, and completion of rubrics by the instructor and the students themselves (self- and peer-evaluation). Enrollment will likely be approximately 5 students each time the course is offered.

The students will be spending considerable class time in local elementary and middle schools for field work.

MUSIC 445W Emphasis in High School Band (3) Examination and application of teaching strategies and materials for students planning to teach high school bands.

MUSIC 445W Capstone Experiences in High School Band (3)
This course is intended to prepare pre-service teachers to teach high school band. Students will observe, analyze, and discuss the teaching techniques, methods, and materials used by public school teachers in high school band instructional settings. Students will prepare and implement rehearsal plans including assessments, in-depth investigation of appropriate repertoire for use in high school bands and concert programming. Students will develop score analysis skills necessary to plan and guide music making and learning in the band rehearsal. Students will develop materials and strategies that strengthen the connection of instrumental performance to the public school curriculum. Students will develop a written philosophy of music education and the role instrumental performance in band within the music education of high school students. Students will consider practical matters associated with teaching in the public schools such as: scheduling, interaction with parents/teachers/administrators, parental support organizations (music boosters), advocacy, community/school support, and long-range instrumental music program development plans.

MUSIC 450 Teaching Marching Band (2) Traditional and contemporary drill design principles, show development strategies, instructional techniques, and organizational procedures involved in teaching marching band.

MUSIC 450 Teaching Marching Band (2)
(BA) This course meets the Bachelor of Arts degree requirements.

MUSIC 450 is a marching band technique course for music education majors, band directors, and experienced marching band members. This course develops knowledge and skills required to organize and teach marching band with an emphasis on traditional and contemporary drill design and charting. Students are taught an eclectic understanding of drill systems, contemporary drill design, and visual design theory with opportunities to apply drill design computer software (Pyware Java 3D) in developing effective movements for marching units. Course topics include philosophy and role of marching band in the music program, historical perspectives, marching band styles, administration and organization of the marching band and auxiliary units and teaching techniques.

General Education: None
Diversity: None
MUSIC 451 Computer Programming for Musicians (3 per semester/maximum of 12)

In-depth study of music programming techniques.

This is an in-depth study of a given music programming language or environment. The language/environment will vary from semester to semester, to include languages such as SuperCollider and Max/MSP. Students will be expected to work independently on a series of projects that require increasing levels of difficulty in programming methodology. The course may be repeated for credit.

Students will be acquainted with the basics of how the programming environment treats fundamental matters such as signal flow, defining functions, variables and arguments, and music synthesis techniques.

These principles will be expanded, with added layers of complexity to the types of problems presented. More complex instruments, processing, and filtering will be covered, along with real-time capabilities (ability of the program to respond to input from audio input or data from an external controller) and the creation of graphical user interfaces (GUIs).

Advanced topics will include algorithmic composition and the creation of plug-ins that may be used by other programs.

As this is an upper division class, students will be expected to be self-motivated and work independently. Assignments will present problems that may be approached in a number of ways - there is no single right answer; putting it another way, the correct answer is the one that works.

Students pursuing the minor in Music Technology (MUTEC) are required to complete two elective courses, one of them upper division. This course will serve those students wishing to apply the minor to areas of software development.

Along with MUSIC 455 Technology in Music, this course may also serve as the second part of an elective music technology cognate for students in the graduate and IUG programs in music theory.

MUSIC 452 Computer Music Synthesis (3)

Use of sound synthesis software for music creation.

MUSIC 453 Recording Studio Training (1)

Training in how to use a professional multi-track recording studio.

MUSIC 455 Technology in Music (1-3:1.5:1.5)

Survey of how musical information is stored and processed in computer

The Pennsylvania State University
MUSIC 455 Technology in Music (3)
(BA) This course meets the Bachelor of Arts degree requirements.

This course provides a survey of how musical information is stored and transmitted in digital devices. It will be divided into three sections.

Weeks 1 and 2 are an introduction to acoustical principles such as the nature of sound transmission and measurements of frequency, sound power level, phase, timbre, and localization. Computer basics will also be covered, with topics to include binary number representation and basic computer operation.

Weeks 3 through 8 cover the MIDI transmission protocol that enables musical information to be stored and transmitted efficiently. Topics include the nature of the MIDI data structure, the types of messages that may be passed, and the suitability of MIDI for expressive performance. MIDI software is discussed, including notation software, editor/librarian software, and sequencers. The bulk of the course's project component involves working with sequencing programs. Students are also exposed to using MIDI on the web, downloading files and importing them into various applications.

Weeks 9 through 15 cover digital audio so that students may understand how instruments capable of understanding MIDI messages are able to translate the instructions into audio signals. Topics include sampling theory, digital vs. analog recording, filters, signal processing, and editing sound files. Projects involving digital audio also use a sequencing program that is able to combine MIDI and audio data.

The students are expected to work independently to complete reading assignments according to the schedule outlined in the course syllabus. While due attention will be given to discussion of this material in class, the primary focus of class sessions will be hands-on application, to ensure that students master a set of skills on the computer.

MUSIC 458 Electronic Music Composition (3) An introduction to the art of composition in the electronic audio medium.

MUSIC 458 Electronic Music Composition (3)
(BA) This course meets the Bachelor of Arts degree requirements.

Music 458 will focus on the creative craft of musical composition in the medium of electronic audio. Topics covered will include but not be limited to: recording, MIDI and digital audio techniques, study of literature and the investigation of the creative process in musical composition. Students are expected to enter the class with strong fundamentals in both music theory and MIDI and digital audio. The student will be expected to complete several projects that demonstrate both their creativity and their technical competence in the medium.

MUSIC 467 Opera Workshop (1-3 per semester/maximum of 6) History, analysis, and production of operas from sixteenth century to present.

Opera Workshop (1-3 per semester/maximum of 6)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
MUSIC 468 Acting for Singers (2 per semester/maximum of 4) To help students develop authentic and specific characters/portrayals on stage through physical and emotional awareness.

This is a course teaching singers the fundamentals of acting. All types of stage work related to vocal music will be explored from performing in recitals and concerts to the opera and excerpted scenes. The objective of the course is to make singers more comfortable on stage and more realistic/believable in their performances/presentations. This course differs from acting courses offered in other areas because the singer has restrictions placed upon him due to the requirements of the music, especially in regard to timing and the sense of time, and the use of texts which are often in foreign languages. The course will be offered to music majors currently studying voice at an advanced level (V220J or higher) so that vocal technique will not be the main issue; this includes students enrolled in the BM, BMA, BA, and BME programs. Exceptions can be made by permission of the instructor. The course is an elective 2 credit course which students may repeat for a maximum of 4 credits. An accompanist will be present to accompany students in their song/aria presentations. Every class meeting will begin with warm-up exercises and then continue with further exercises focusing on helping students develop a sense of timing and enabling them to explore the "beats" (or central topic) of a scene. Emphasis will be placed on learning how to prepare for a scene, analyze it, and determining the goal(s) of the character. The students will be encouraged to learn how to be specific in their acting and to learn what will "read" to an audience while accurately reflecting the portrayed emotion. Some work will be solo work, but there will also be opportunities to work with partners. Improvisation will also be incorporated.

MUSIC 471 Structural and Sixteenth-Century Counterpoint (2) Advanced species counterpoint and its application to the sixteenth-century style.

MUSIC 472 Eighteenth-Century Counterpoint (2) Imitative and nonimitative counterpoint in the style of Bach.

MUSIC 473J Composition VII (3) Composition instruction for fourth-year composition majors.

**MUSIC 491 Advanced Chamber Ensemble (1 per semester/maximum of 4)** Preparation and performance of advanced chamber music.

**MUSIC 491 Advanced Chamber Ensemble (1 per semester/maximum of 4)**

Advanced Chamber Ensemble meets at least two hours per week - once with the instructor for coaching and at least once for an additional rehearsal without the instructor’s presence. Course objectives include, but are not limited to, the development of rehearsal and ensemble skills, an increased awareness of musical styles, public performance(s) of works prepared, and the development of the interpersonal skills necessary for the players to operate as a unit. Chamber music is an integral part of instrumental musical training. It is an important partner with conducted ensembles in the performance preparation of musicians. Evaluation of student work is based on participation in rehearsals, the progress made by the ensemble, and the quality of the ensemble’s performances. The course is offered during fall and spring semesters.

MUSIC 495A Student Teaching: General Music (5-7) Observation and teaching under supervision.

MUSIC 495A Student Teaching: General Music (6-8)

(BA) This course meets the Bachelor of Arts degree requirements.

As required by the Pennsylvania Department of Education, all music education students seeking certification must enroll in a culminating student teaching experience which closely approximates a full-time working experience in the public schools of Pennsylvania. The objective of this course is to offer a transition between student life and professional life directly prior to graduation. This total immersion in the field of GENERAL MUSIC allows the student to learn from and work with a mentor teacher in an off-campus setting. During the semester prior to the course, cooperating music teachers and school districts are contacted requesting their participation and music education students interview with the teachers. The students then move to the community in which they will be student teaching and adopt the practices of that mentor teacher within that specific school district.

Students are evaluated by both the mentor teacher and a Penn State supervisor who visits a minimum of four times per semester. This course is offered every semester.
MUSIC 495B Student Teaching: Choral Music (5-7) Observation and teaching under supervision.

(BA) This course meets the Bachelor of Arts degree requirements.

MUSIC 519 Graduate Seminar in Intermediate Piano Pedagogy (2) Graduate seminar in intermediate teaching repertoire and strategies for piano from the Baroque to the 21st century.

Graduate Seminar in Intermediate Piano Pedagogy (2)

This course is intended for pianists in the degrees Master of Music and Doctor of Musical Arts who will have already passed the introductory undergraduate course in Intermediate Piano Pedagogy, MUSIC 424, or the current Graduate Seminar in Piano Pedagogy, MUSIC 589 (which will continue to be offered; it is required for piano pedagogy major students in the Master of Music degree), or an equivalent of one of these courses at another institution. The material will be covered in class discussions, reading and listening assignments, and in-class student presentations. Writing, performing, and speaking will be required. The course is designed to give developing professional pianists and piano teachers greater depth of knowledge of the pedagogical repertoire than is possible either in the introductory course or through their own concurrent teaching experiences. The seminar format encourages group discussion as well as independent work.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2008
Prerequisite:
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**MUSIC 520** Chamber Music for Strings (1 per semester, maximum of 4) Preparation for performance of (advanced) chamber music literature involving primarily stringed instruments—quartets and quintets.

Effective: Fall 2012

MUSIC 585 Graduate Seminar in Keyboard Music 1710 to 1820 (2) Seminar in music for keyboards (organ, harpsichord, pianoforte) from the early works of J.S. Bach (c. 1710) to late Beethoven.

This first of three seminar courses is intended for pianists in the degrees Master of Music and Doctor of Musical Arts who will have already passed the introductory survey in Keyboard Literature, MUSIC 481 or its equivalent at other institutions. The material, dealing with the periods beginning with late Baroque (J.S. Bach, Handel, Domenico Scarlatti) and ending with Beethoven, will be covered in class discussions, listening assignments, and student presentations in class. Both writing and speaking will be required. The course is designed to give developing professional pianists greater depth and breadth of knowledge of their repertoire than is possible either in the introductory survey or in their own practice. The seminar format encourages group discussion as well as independent work.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2008
Prerequisite:

MUSIC 586 Graduate Seminar in Piano Music 1820-1920 (2) Seminar in music for pianoforte from the early works of Schubert, circa 1820, to Rachmaninoff (Romantic and post-Romantic).

This course is intended for pianists in the degrees Master of Music and Doctor of Musical Arts who will already have passed the introductory survey in Keyboard Literature, MUSIC 481, or its equivalent at other institutions. The material, in this case the Romantic music that is the core of pianists’ repertoire, will be covered in class discussions, listening
assignments, and student presentations in class. Both writing and speaking will be required. The course is designed to
give developing professional pianists greater depth and breadth of knowledge of their repertoire than is possible either in
the introductory survey or in their own practice. The seminar format encourages group discussion as well as independent
work.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2008
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details
check the specific course syllabus.

MUSIC 587 Graduate Seminar in Piano Music 1890-Present (2) Seminar in modern music for pianoforte from the early
works of Debussy (circa 1890) to the present day.

MUSIC 587 Graduate Seminar in Piano Music 1890-Present (2)
This course is intended for pianists in the degrees Master of Music and Doctor of Musical Arts who have already passed
the introductory survey in Keyboard Literature, MUSIC 481, or its equivalent at other institutions. The most extensive
treatment will be given to Debussy and Ravel in the first weeks, and later to Schonberg and his followers, as well as
Bartok, Stravinsky, Hindemith, Ives, Messiaen and other outstanding figures. Less-well known composers of superior
accomplishment will also be addressed. The material will be covered in class discussions, listening assignments, and
student presentations in class. Both writing and speaking will be required. The course is designed to give developing
professional pianists greater depth and breadth of knowledge of their repertoire than is possible either in the introductory
survey or in their own practice. The seminar format encourages group discussion as well as independent work.

KEYBD 580J Piano Performance Doctoral/Artist Level (4) One-hour weekly piano lessons with jury examination at end of each semester; repeatable course; four semesters required.

KEYBD 580J Piano Performance Doctoral/Artist Level (4)
KEYBD 580J consists of one-hour weekly lessons, like other private applied music lessons in the School of Music. The repertoire to be performed and the standards of preparation will be at the highest level, for pianist-students in the degree Doctor of Musical Arts, who will have already completed a Master of Music in Performance. This standard, which will be enforced via a jury examination at the end of the semester, will require large amounts of independent practice, and therefore will be valued at four credits per semester. Four semesters minimum (16 credits) will be required.

Music - Voice (VOICE)

**VOICE 412J Musical Theatre Voice V (2)**

VOICE 412J continues to develop a vocal approach and technique to musical theatre repertoire. It is required of fourth-year musical theatre students. All aspects of vocal production are explored. The voice sequence is a required element of the B.F.A. musical theatre training program. Grading will be based on attendance, preparation, and attitude. These are all critical factors for entering the profession and for successfully completing this course. Deadlines and appointments must be kept. Students must do adequate outside preparation. VOICE 412J is a requirement for the B.F.A. in musical theatre. It is offered every fall semester with an enrollment of approximately 15 students.

Neuroscience-Hy (NEURO)

NEURO 501 Neuroscience Seminar (2 per semester/maximum of 8) This is a weekly seminar involving discussion of research approaches and methodologies used by guest speakers for the neuroscience seminar series.

NEURO 501 Neuroscience Seminar (2 per semester/maximum of 8)
This course examines issues related to the research presented by invited speakers in the Neuroscience Seminar series. This is a required course for first and second-year graduate students in the Neuroscience program. The intent is to generate discussion that aids in the understanding of the general research questions, techniques and conclusions reflected in the work of the various speakers. Speakers will address topics ranging from the molecular to human behavior. The Neuroscience Seminar course has two components: (1) the students present on the background research (approaches, methods, and concepts) related to the invited speaker's work. The students will read 2-3 papers from a list of the speaker's publications prior to the seminar. The host of the invited speaker (and sometimes the speaker himself or herself, depending on availability) will join the students in the discussion. Each time there will be one student who leads the discussion. Students will participate in discussions with the invited speaker, the instructor, and with other students who may have different research experiences and backgrounds. (2) the students will attend the seminar delivered by the invited speaker and participate in the discussion and question and answer periods.

Effective: Summer 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NEURO 511 (ANAT 511) Neurobiology II (3) Structure and physiology of central and peripheral nervous system, including specific sense organs.

Neurobiology II (3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1987
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NEURO 512 Comparative Neuroanatomy (4) This course elucidates the structural organization of the nervous system and describes the evolutionary principles that guide brain development.

NEURO 512 Comparative Neuroanatomy (4)
This course provides instruction on the functional and structural organization of the vertebrate central nervous system. In addition to lectures, students attend laboratory sessions devoted to human brain dissections, histologic sections of various vertebrate brains, and non-invasive magnetic resonance images. Following instruction on the structural and physiological properties of neurons, students learn how structural and neurochemical variations endow neurons with specific computational properties so that connections between different neuronal subtypes enable local circuits to extract information and create specific input-output transformations that define the functional character of each neural system. The structural organization of the brain is then described both grossly and at the level of functional circuits.
Material at the gross level describes the 3-D spatial relationships among the nuclei and fiber tracts within each subdivision of the central nervous system so that students can describe the internal organization of the forebrain, midbrain, hindbrain, and spinal cord. As part of this, students learn to recognize specific structures in different planes of sections along the major axes of the brain.

Material at the functional level describes the sensory, motor, and limbic systems according to their circuit connections. Emphasis is placed on the specific connections that enable circuits to transform specific types of information. Students are expected to describe the successive series of nuclei and interconnected pathways that comprise each major neural system.

Students are also taught to view neuroanatomy as a scientific field of inquiry. Landmark discoveries and the methods by which prominent neuroanatomists made those discoveries provide a context for describing brain organization. Breakthrough scientific experiments are discussed to illustrate how the structural-functional relationships of the brain have been elucidated. Attention is also devoted to instructing students in modern experimental methods that are used to determine how brain circuits are altered by experimental manipulations.

While the course emphasizes the mammalian nervous system, many aspects of brain organization in non-mammalian vertebrates are presented. In the last third of the course, students read a monograph focused on the principles that guided vertebrate brain evolution across different phylogenetic lineages. A series of lectures are devoted to neurocladistics and the evidence that has prompted competing theories of brain evolution so that students can critically evaluate differences in brain organization across different groups of vertebrates.

NEURO 740 Neurology Clerkship (5) To teach the principles and skills underlying the recognition and management of the neurologic diseases that a general medical practitioner is most likely to encounter in practice.
NEURO 740 Neurology Clerkship (5)

The medical student will rotate on the Neurology service at one of the three sites (Penn State Hershey Medical Center, York Hospital, Lehigh Valley Hospital). The student will be assigned to the inpatient and consult services. He/she will be expected to evaluate new patients and follow them during their hospital stay. The student will be expected to perform a comprehensive neurological examination, formulate a differential diagnosis and management plan for each patient. The student will be supervised by a neurology attending. The student will be expected to attend outpatient clinic at least once a week and also attend scheduled conferences. The student will be required to perform a history/neurological examination in the presence of either a senior neurology resident or attending and be graded. A written examination will also be required at the end of the rotation. A packet of assigned reading material and lectures will be provided during the clerkship.

Bachelor of Arts: None
Effective: Fall 2001
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NUC E 403 Advanced Reactor Design (3) Physical principles and computational methods for reactor analysis and design. Multigroup diffusion theory; determination of fast and thermal group constants; cell calculations for heterogeneous core lattices.

Advanced Reactor Design (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 1983
Prerequisite:
NUC E 405 (CHEM 406) Nuclear and Radiochemistry (3) Theory of radioactive decay processes, nuclear properties and structure, nuclear reactions, interactions of radiation with matter, biological effects of radiation.

NUC E 406 (M E 406) Introduction to Statistical Thermodynamics (3) Statistical description of systems composed of large numbers of particles in the context of classical and quantum mechanics; basic concepts of probability theory and thermodynamics as they relate to statistical mechanics.

NUC E (M E) 409 Nuclear Materials (3) Nuclear reactor materials: relationship between changes in material properties and microstructural evolution of nuclear cladding and fuel under irradiation.

NUC E/MATSE 409 Nuclear Materials (3) Nuclear reactor materials: relationship between changes in material properties and microstructural evolution of nuclear cladding and fuel under irradiation.
displacement damage to the material produced by exposure to neutron irradiation. The microstructural evolution that results from the reactor exposure (including radiation damage and defect cluster evolution, and changes) is described. The aim is to create a linkage between these changes at the atomistic level and the changes in macroscopic behavior of the material. Special attention is given to property changes that affect fuel performance and operational safety. Both mathematical methods and experimental techniques are emphasized so that theoretical modeling is instructed by experimental data. Students use the TRIM and SPECTER codes to quantitatively evaluate neutron damage, as well as learn simple analytical models that describe microstructural evolution and property changes under irradiation.

NUC E (M E) 446 Reliability and Risk Concepts in Design (3)
The course covers materials reliability in design including mechanical, electrical and system aspects. Five main topics will be studied. The course starts by introducing engineering risk and reliability, highlighting its interdisciplinary nature and its significance in system design. The concept of reliability as a probability is introduced and the basic laws of probability are
reviewed. The discussion centers on the mathematics needed to understand and analyze complex systems including components in series and parallel. The topics include the independence, mutual exclusivity, truth tables and Venn diagrams. These concepts are then applied to simple systems consisting of one, two and three components in various configurations. The equivalency of the various methods is discussed. The effect of maintenance on a system’s reliability is presented along with discussions of various maintenance strategies. Then, the failure modes and effects analysis is introduced and examples discussed. The concept of fault trees and event trees and their application to reliability analysis are presented. Risk analysis is then introduced as a case study in the application of reliability analysis. A nuclear power plant system is analyzed to quantify the risk to the public from its operation.

NUC E 494H Senior Thesis (1-9)

All Schreyer Scholars are required to complete an undergraduate honors thesis. This work represents the culmination of a
The student's honors experience. Through the thesis, the student demonstrates a command of relevant scholastic work and a personal contribution to that scholarship.

The thesis project can take many forms - from laboratory experiments all the way to artistic creations. The thesis document captures the relevant background, methods and techniques, as well as describing the details of the completion of the individual project. Two Penn State faculty members judge the merits of this Scholar's honors thesis, the student's self-selected thesis supervisor and the department-selected honors adviser in the student's area of honors.

**NUC E 502** Reactor Core Thermal-Hydraulics (3) In-depth analysis of the reactor core thermal hydraulics; computational methods and practical applications.

**NUC E 502 Reactors Core Thermal-Hydraulics (3)**

This course provides students with a background in reactor core thermal hydraulics and enhances their understanding of the important phenomena in a nuclear reactor core, which can determine reactor safety performance. Students will obtain an overall view of reactor safety from the reactor thermal hydraulics perspective. This course examines the outcomes of research projects and international scientific activities in this area. Objectives are met by introducing course modules that utilize state-of-the-art computer codes to solve well established international thermal-hydraulics benchmark problems to demonstrate reactor performance during operational transients. One of the principal goals of the course is to provide students with a computationally intensive curriculum that is consistent with their capabilities and their expectations for a modern reactor thermal hydraulics course.

This course discusses detailed thermal-hydraulic analysis of reactor systems with an emphasis on the application of conservation equations for single- and two-phase flow in detailed modeling of reactor cores using three-dimensional subchannel analysis methods and examines the reactor's core thermal-hydraulic design for core limit analysis. The governing sets of equations that form the basis for the three-dimensional thermal-hydraulic methods commonly used in the nuclear industry will be derived and discussed in addition to specific models that are used for closure. Hot assembly analysis will be performed, as well as core wide analysis, to determine the hot assembly and resulting hot subchannels in the core. Students will use state-of-the-art three-dimensional computer codes to model fuel assemblies and the reactor core to determine the most limiting fuel pin and hottest subchannel.

Background on heat and mass transfer and fluid dynamics is the prerequisite to this course, which provides a basis for understanding reactor core thermal-hydraulic analysis.

NUC E 511 Nuclear Reactor Kinetics and Dynamics (3) Analytical kinetics and dynamics modeling for reactivity-induced transients; reactor accident kinetics methods for simple and complex geometries; experimental methods.

**Nuclear Reactor Kinetics and Dynamics (3)**

This course provides students with a background in the area of nuclear reactor kinetics and dynamics and enhances their understanding of the important multi-physics phenomena in a reactor, which can determine reactor safety performance. Students will obtain an overall view of nuclear reactor safety from the nuclear reactor dynamics perspective. This course examines the outcomes of research projects and international scientific activities in the area of reactor dynamics. Objectives are met by introducing course modules that utilize state-of-the-art computer codes to solve well established international coupled thermal-hydraulics and neutronics benchmark problems to demonstrate reactor performance during operational transients. The course will be based on modules that demonstrate the Light Water Reactor (LWR) behavior utilizing state-of-the-art computer codes to solve well established Organization for Economic Cooperation and Development (OECD) coupled code benchmark problems. A supplementary module will also be developed which focuses on the High Temperature Reactor (HTR) in order to demonstrate the dynamic and safety issues unique to an advanced next generation reactor. The course will provide students with a computationally intensive modular curriculum that the instructor can utilize as appropriate to complement the nuclear reactor kinetics and dynamics concepts.

This course focuses on nuclear reactor kinetics and dynamics methods and techniques for multi-dimensional safety and transient analysis. It consists of five major topics: review of point nuclear reactor kinetics theory; reactivity feedback and nuclear reactor dynamics; methods for spatial kinetics; coupled and multi-dimensional thermal-hydraulics/neutron kinetics; and, experimental determination of reactor dynamics parameters. A computer project provides students with knowledge about state-of-the-art methods used to model reactor transients for safety evaluations.

Background on basic reactor physics and analysis is the prerequisite content to this course, which provides a basis for understanding nuclear reactor kinetics theory and nuclear reactor dynamics phenomena.

NURS 403 School Health and Emergency Care of Children and Adolescents (3) Techniques for higher-level care for school health and emergency situations and application-based education.

NURS 403 School Health and Emergency Care of Children and Adolescents (3)

This course is a part of the school nurse series and will provide participants with advanced techniques for school health professionals that respond to health and emergency situations. The topics covered will include abdominal, genitourinary, head, musculoskeletal, and sports-related injuries. Students also will review shock, respiratory, neurologic, psychological and behavioral emergencies, and a wide array of issues facing students with special needs. Additionally, the participant will review disaster planning, preparation, and response activities. The course will review major medical and accidental situations facing the school nurse including the inter-agency coordination with emergency response systems and community entities. Students will learn what to include in a report for the communication center and emergency medical services. Skills stations for orthopedic injuries, trauma, and medical situations will allow students to practice skills and receive immediate feedback. Students will participate in application based education that utilizes case studies to pull the concepts together. Students will be asked to provide return demonstration for skills reviewed in this course.

NURS 404 Cardiac Dysrhythmias: Interpretation, Treatment, and Nursing Management (1) An introductory course with a focus on dysrhythmia recognition and interpretation of abnormal 12-lead electrocardiograms (EKG, ECG).
NURS 404 Cardiac Dysrhythmias: Interpretation, Treatment, and Nursing Management

NURS 404 (Cardiac Dysrhythmias: Interpretation, Treatment, and Nursing Management) is an introductory course in dysrhythmia recognition and interpretation of normal and abnormal rhythm strips and 12-lead electrocardiograms. The course involves integration of electrophysiology principles, anatomy, physiology, and arrhythmogenesis in interpretation of dysrhythmias. The diagnosis, medical treatment, and nursing management will be incorporated through case study analysis. Evaluation of course content will be done through exams, in class worksheets, and case study analysis. The class is open to nursing and non-nursing majors desiring introductory understanding of cardiac dysrhythmias. NURS 404 is a good course for nursing majors interested in critical care and non-nursing majors interested in emergency medical services associated with any major (e.g., Kinesiology). The class is offered fall and/or spring semester with enrollment limited (20 students) to allow interactive hands-on interpretation of dysrhythmias.

NURS 407 Drugs of Abuse and Mental Health Issues (3)

NURS 407 is an elective course which examines the issue of substance abuse in today's society. It looks closely into the health care needs across the lifespan of clients who have an alcohol or other drug disorder. Pharmacological, behavioral, biological, and sociocultural characteristics, along with factors and patterns of addiction, are discussed and then how these factors and characteristics relate to mental illnesses are further explored. The different classes of habit-forming drugs are covered and various treatment options are examined. The student is evaluated by written examination, research project, and/or community focus logs. This is an elective course placed in the spring semester and available to both nursing and non-nursing students in related fields. The course objectives follow.

Upon completion of this course, the student will be able to:

a. Know the difference between pharmacological and behavioral definitions of addiction.
b. Understand the biological basis of drug action and addiction.
c. Understand the comorbidity of major mental disorders and drug use issues.
d. Understand the sociocultural factors of drug use and abuse.
e. Describe and discuss the main characteristics of alcohol abuse, treatment, and recovery.
f. Describe and discuss the main characteristics of stimulant abuse, treatment and recovery.
g. Describe and discuss the main characteristics of marijuana and nicotine abuse and treatment.
h. Describe and discuss the main characteristics of hallucinogen and inhalant abuse and treatment.
i. Describe and discuss the use and abuse of prescription drugs.
j. Understand the concept of Dual Diagnoses—the simultaneous existence of an alcohol and other drug disorder with a psychiatric disorder.
k. Analyze how the use of drugs by an individual with a mental illness complicates treatment and recovery.

NURS 408 Clinical Application of Pharmacological Concepts (1)

NURS 408 is an elective course designed to provide the interested student an in-depth review of pharmacology. The application of pharmacological concepts in relation to the clinical setting is a primary focus of the course. The various drug classes are discussed with emphasis placed on care of the patient while administering different types of medications. Discussion of pharmacological principles and patient care requires knowledge and integration of anatomy, physiology, pathophysiology, and medical and nursing treatments for various disorders. NURS 408 provides an excellent review of medication classes as related to medical condition in preparation of the nursing student taking the NCLEX licensure examination upon graduation. The student is evaluated by written examination and/or case study interpretation. NURS 408 is placed in the spring semester and is open to all nursing students who have successfully completed administering medications in the 300 level nursing courses and are concurrently enrolled in the 400 level nursing courses. Enrollment is not limited in numbers. Course objectives are as follows.

Upon completion of this course, the student will be able to:

a. Categorize commonly used medications by major classifications of drugs.
b. Predict classifications of medications given to specific clinical conditions.
c. Develop patient teaching plans relevant to medication administration.

The Pennsylvania State University
d. Discuss research related to pharmacology which influences nursing practice.

NURS 409 Introduction to Forensic Nursing (3) Provides an introduction to the forensic health sciences, forensic nursing, and the nursing role in the scientific investigation of violence.

NURS 409 Introduction to Forensic Nursing (3)

NURS 409 is an elective course describing the role of the nurse in the forensic sciences. It is designed to provide the interested student an in-depth study of nursing forensics and provides an introduction to the forensic health sciences, clinical forensic nursing, and the nursing role in the scientific investigation of violence. NURS 409 describes the principles and philosophy of forensic nursing in acute care and community settings and the roles of the forensic science professional and advanced practice forensic nurse are explored. The students are evaluated through case study interpretation, papers, and written examination. The topics included in NURS 409 require the student to have a basic understanding of nursing skills and the professional role of the nurse, therefore, NURS 409 is placed in the spring semester and all Junior-Senior level nursing students are eligible to enroll for it. Course enrollment is not limited. The course also provides an excellent opportunity for the nursing student to collaborate with Sociology/ Criminal Justice in order to obtain a minor in forensics. The course objectives follow.

Upon completion of this course, the student will be able to:

a. Describe the scope of the practice of the advanced practice forensic health professional.
b. Identify and analyze current forensic science and nursing issues and trends.
c. Identify the role of the advanced practice forensic health professional/ forensic nurse in the holistic care of victims of trauma, perpetrators of human violence, and families of both.
d. Describe the role of the advanced practice forensic nurse in the development of protocols and standards for professional practice.
e. Verbalize the connection between advanced practice theories with forensic nursing content while integrating forensic roles into various advanced practice arenas.

NURS 415 (US;IL) Community and Family Health Nursing (4) Therapeutic nursing care and health promotion concepts to families, groups and populations in the community.

NURS 415 Community and Family Health Nursing--Concepts and Applications (4) (US;IL)
NURS 415 US;IL focuses on nursing care of clients in the community and the family. This course allows students to work independently providing and improving health care of population groups within a diverse society. Upon completion of this course, the student will be able to synthesize knowledge from nursing, public health, family, and community theory as a foundation for culturally congruent community health nursing practice; utilize the nursing process and principles of primary, secondary, and tertiary prevention that are culturally appropriate in the care of community based clients who differ in terms of age, developmental stage, health beliefs values and practices; demonstrate interpersonal skills necessary for collaboration with and among culturally diverse consumers, community agencies, health professionals, and health related resources in the community; demonstrate the management and safety of client, family, and community care through appropriate use of concepts of leadership, case management, and group process; demonstrate understanding of epidemiological methods in gathering, analyzing, and utilizing data and be able to apply to diverse populations in the community; use coherent comprehensive, culturally sensitive and age appropriate communication in oral and written form; analyze biostatistical/epidemiological data and nursing evidence-based research findings to improve/enhance the delivery of nursing care to diverse populations in the community; identify recommended health screenings and immunizations and health promotional strategies throughout the life span; analyze the impact of culture as a significant influence on the health perceptions, interpretations, and behaviors of diverse groups; demonstrate the ability to perform comprehensive and risk assessments, to make critical decisions, and to take appropriate nursing actions in the area of community health; demonstrates the ability to practice the principles of health and safety in a caring manner to maximize client care outcomes across the lifespan.

Teaching strategies include lecture, audiovisuals, student presentations, discussion, clinical experiences, guest speakers, laboratory simulation and clinical experiences in varied clinical settings where the students are responsible for assessing, planning, implementing, and evaluating the care of families within the context of a community. Students have the opportunity to analyze the impact of culture on health perceptions, interpretations, and behaviors of diverse groups. The course is offered fall and spring semester of the senior year with approximately 120 students (60 at UP and 60 at HMC enrolled in clinical sections limited to 10 students per section).

NURS 417 (US;IL) Family and Community Health Concepts (4) Study of the concepts of family and community based nursing care emphasizing multicultural influences on health practices.

NURS 417 Family and Community Health Concepts (4) (US;IL)

Upon completion of the course the student will be able to (a) Synthesize knowledge from nursing, public health, family, and community theory as a foundation for culturally congruent community health nursing practice that is sensitive to race, religion, gender, disability and sexual orientation; (b) Utilize the nursing process and principles of primary, secondary and tertiary prevention that are culturally appropriate in the care of community based clients who differ in terms of health beliefs, values, and practices; (c) Develop skill in the use of independent/interdependent nursing actions to deliver care to clients across the life span; (d) Demonstrate the management of client, family, and community care through appropriate use of concepts of leadership, case management and group process; (e) Describe collaboration at the collegial level with nurses and other members of the health care team to provide continuity of care through culturally appropriate communication, consultation, and referral; (f) Use coherent, comprehensive and culturally sensitive communication in oral and written form; (g) Analyze biostatistical/epidemiological data and nursing research findings to improve/enhance the delivery of nursing care to diverse populations in the community; (h) Analyze the impact of culture as a significant influence on the health perceptions, interpretations, and behaviors of diverse groups.

Students will spend 40 hours practicing in a clinical setting. In that setting they will be responsible for assessing, planning, implementing and evaluating the care of families within the context of a community. Students will have the opportunity to analyze the impact of culture on health perceptions, interpretations, and behaviors of diverse groups.

Evaluation methods: Students will be evaluated both theoretically and clinically by use of the following: (a) Guided study of complex family and community health patterns using collaboration case analysis; (b) Case findings and analysis; (c) Direct care to culturally diverse families in the community setting.

Relationship/linkage of course to other courses: This course applies and integrates family and community nursing concepts to culturally diverse clients in the community. It is offered at the senior level and incorporates previously learned theoretical and clinical nursing knowledge with an appreciation for how diversity influences the health care behaviors of families and communities as they relate to the health care system.

Relationship of course to major: This senior level nursing course is one of the components of the Advanced Standing Option. It is a required course that provides students with the opportunity to develop skill in delivery of health services to globally diverse populations across the life span. It is also designed to increase the student’s knowledge base related to the community based client including relationship, lifestyle and kinship patterns. Lastly, it provides an arena for community health planning for diverse populations.

Special facilities required to teach the course: The clinical arena which will be used to teach this course includes but is not limited to high risk populations in the community, senior or special housing projects, prisons and missions.

Frequency of offering an enrollment: The course will be offered every semester and enrollment varies from 10 to 20 students.
NURS 420 Mental Health Nursing (4) Emphasizes clinical application of mental health theory in nursing care of patients with acute and chronic mental health problems.

NURS 420 focuses on care of clients experiencing mental health problems and emphasizes the clinical application of mental health theory in nursing care of patients with acute and chronic mental health problems. Upon completion of this course, the student will be able to synthesize knowledge from nursing and the social, health, and behavioral sciences to describe the nature of mental adaptations throughout the lifespan; demonstrate effective therapeutic communication skills when dealing with clients, groups, and families experiencing maladaptive responses to stress; assess the strengths and weaknesses of the client and family in the context of a group and community environment; demonstrate the ability to perform comprehensive and risk assessments, to make critical decisions, and to take appropriate nursing actions in the area of psychiatric mental health; utilize the nursing process as related to the Standards of Psychiatric and Mental Health Nursing practice; collaborate with nursing colleagues, mental health professionals, and consumers in the practice of psychiatric mental health nursing; analyze individual and societal forces that effect nursing research and evidence based practice in the area of psychiatric mental health nursing; demonstrate the knowledge of self needed to be an effective therapeutic agent and client advocate; demonstrate culturally competency and the ability to provide holistic psychiatric mental health nursing care; perform the principles of psychiatric mental health and safety in a caring, nonjudgmental manner; demonstrate a current and relevant knowledge base of legal and ethical issues that can be applied to psychiatric mental health nursing; identify and support mental health promotion and mental health educational activities to maximize client care outcomes and evaluate psychiatric mental health nursing as a professional specialty. Teaching Strategies include lecture, process recordings, discussion, selected readings, audiovisuals, laboratory simulation, and clinical experiences. NURS 420 is offered fall and spring semesters with an annual enrollment of approximately 120 students (60 at UP and 60 at HMC) with clinical sections limited to 10 students each.

NURS 430 Organization and Administration for the Nurse Manager (3) Introduction to organizational theory and principles of practice in the administration of nursing services and patient care.

NURS 430 is the first of four courses included in the nursing management series, which focuses on leadership and management in nursing. NURS 430 includes a study of the history of American management and the influences on management styles and approaches. Topics covered in the course include: Leadership theory, Change theory, Health care organizational structure and functions, Legal and Ethical issues, Nursing Management structure, function, and roles, Power and politics, Communication; and Nursing care delivery systems. The course is offered in traditional classroom instruction, on-line through ANGEL at selected campus sites and through World Campus. Course evaluation criteria may include examination, case studies, and student projects or presentations as assigned by the faculty. Upon completion of all 4 courses, students receive a certificate of completion of the Nursing Management Series from the school of nursing.

NURS 431 Data Management for Nurse Managers (3) Analysis of information systems to manage nursing service organizations; includes financial management, the budgeting processes, and productivity measurement.

NURS 431 is the second of four courses included in the nursing management series, which focuses on leadership and management in nursing. NURS 431 includes a study of information systems and financial aspects of managing health care organizations and patient care delivery. Topics covered in the course include: Information systems in health care, Electronic medical record, Security and portability of health care information. Topics related to budget and finance
include, operating and capital budget management, nurse staffing systems and productivity. Lab activities enable students to develop proficiencies with spreadsheet software. The course is offered in traditional classroom instruction, on-line through ANGEL at selected campus sites and through World Campus. Course evaluation criteria may include examination, case studies, and student projects or presentations as assigned by the faculty. Upon completion of all 4 courses, students receive a certificate of completion of the Nursing Management Series from the school of nursing.

NURS 432 Nursing Management of Human Resources (3)
NURS 432 is the third of four courses included in the nursing management series, which focuses on leadership and management in nursing. NURS 432 includes a study of human resource management with an emphasis on application to nursing and health care organizations. Topics covered in the course include: Employment laws, hiring, termination and managing staff turnover, conflict management, staff development and productivity, organized labor and unions, the impaired nurse, and discussion of nursing standards, ethics, delegation and the nursing shortage. The course is offered in traditional classroom instruction, on-line through ANGEL at selected campus sites and through World Campus. Course evaluation criteria may include examinations, case studies, and student projects or presentations as assigned by the faculty. Upon completion of all 4 courses, students receive a certificate of completion of the Nursing Management Series from the school of nursing.

NURS 433 Seminar for Nurse Managers (3)
NURS 433 is the fourth of four courses included in the nursing management series, which focuses on leadership and management in nursing. NURS 433 is designed to allow the student to explore issues that challenges individuals in the nurse manager role. Designed with a seminar approach the student will study the following topics: The future of nursing leadership, mentoring, networking, stress management for the nurse manager and avoiding burnout, managing patient care quality and regulatory compliance, and implementing change. Students also complete a field observational study with a nurse manager or nurse executive in a health care organization. It is recommended that students complete at least one of the previous nursing management (NURS 430, NURS 431, NURS 432) courses prior to enrolling in this course. The course is offered in traditional classroom instruction, on-line through ANGEL at selected campus sites and through World Campus. Course evaluation criteria may include examinations, case studies, and student projects or presentations as assigned by the faculty. Upon completion of all 4 courses, students receive a certificate of completion of the Nursing Management Series from the school of nursing.

NURS 440 Trauma/Critical Care Nursing (3)
NURS 440 is designed as an introductory study of the impact of like-threatening physical problems across the life-span utilizing the nursing process. The course focuses on problems encountered in the hospital critical care setting and is a nursing elective. Upon completion of this course, the student will be able to meet the following objectives: Integrate knowledge from nursing and related disciplines into case study format for persons with life-threatening illnesses; Explore practice, ethical, legal and interpersonal dimensions within the critical care setting. Identify problems for nursing critical care research. Study the most common illnesses in the critical care setting for the neurological, respiratory, cardiac, renal,
NURS 450B is the clinical capstone course for the Nursing Program. Students will spend 135 hours practicing in a clinical setting, where they will be responsible for assessing, planning, implementing and evaluating the care of clients. Students will have the opportunity to employ management and delegation skills in the care of clients. Upon completion of this course, the student will be able to demonstrate the ability to practice in a holistic, culturally competent and caring manner; demonstrate the ability to practice within the context of professional, ethical, regulatory and legal codes of nursing practice; demonstrate the ability to promote, support, and facilitate the health, well being, and comfort of vulnerable populations so as to enhance the quality of service delivery; demonstrate the ability to perform comprehensive and systematic assessments and take appropriate actions; demonstrate the ability to utilize evidence based practice and modern technologies to assess and respond appropriately to patient needs; utilize nursing skills to provide optimum care and to practice principles of health and safety in a caring, nonjudgmental manner; utilize nursing skills to respond to a person’s needs throughout the life span, i.e. life choices, disability, and end of life issues; demonstrate current and relevant knowledge of the social, health, and behavioral sciences that can be applied to nursing practice; demonstrate current and relevant knowledge of ethical, legal, national, and international policies that can be applied to nursing practice; demonstrate current knowledge of nursing research to provide nursing care that is rigorous and evidence based; demonstrate current knowledge of nursing research to provide nursing care that is rigorous and evidence based; demonstrate the ability to communicate effectively (including the use of technology) with patients, families, social groups and the health care team; identify, manages and support health promotion and health educational activities to optimize patient safety and well being; demonstrate the ability to lead and coordinate a team, delegating care appropriately; demonstrate the ability to assess risk and actively promote the well being, safety, and security (patients and coworkers) in the work environment; demonstrate increased confidence in the nurse generalist role and in the value of life-long learning. Teaching strategies include laboratory simulation and clinical experiences and pre and post clinical seminars. The course is offered each spring semester and is one on one preceptor based clinical experience.
NURS 452 (US) (BB H 452, WMNST 452) Women's Health Issues (3) Exploration of major health issues concerning women today, with an emphasis on social, cultural, and medical influences.

NURS 459 Legal and Professional Issues in School Nursing (3) Legal and professional issues of school nurses and delivery impact of health care in school environment.

NURS 459 Legal and Professional Issues in School Nursing (3)

This course is part of the school nurse series. This course encompasses the synthesis and analysis of the legal and professional issues faced by school nurses and other professionals in the school setting. Strategies on the legal and professional delivery of health care in the school environment are integral to the course. Objectives include: explore legal and ethical issues influencing school nursing practice; analyze attributes of the legal and professional issues faced by school nurses and other professionals; develop strategies for addressing school nursing, interdisciplinary or health care issues; analyze issues that impact the resolution of special problems in school-age populations; identify resources and management strategies available to the school nurse and other professionals in meeting the needs of at risk school-aged populations.

NURS 460 Advanced Concepts in Clinical Nursing Informatics (3) An exploration of clinical informatics tools to support informatics practice.

NURS 460 Advanced Concepts in Clinical Nursing Informatics (3)
Advanced Concepts in Clinical Nursing Informatics prepares nurses to support, promote, and assist in the implementation and efficient and safe use of informatics tools in the fast-paced, technology rich clinical healthcare environment. Students will explore electronic health records, clinical decision support tools, database management and data mining, patient safety technologies, and the clinical workflow implications and meaningful use of each. Students will learn principles of health care organizational culture, change theory, and the System Development Life Cycle (SDLC) to prepare them to assist with project management as informatics tools are introduced in the clinical environment. The use of informatics tools to support knowledge management in an organization is also emphasized. Students will discover the benefits and barriers of Health Information Exchange (HIE) in the promotion of public health. Finally, students will discover the competencies, skills, roles, and standards of informatics nursing practice.

NURS 461 Perioperative Nursing (4)
Comprehensive introduction regarding fundamental principles and practices of the Operating Room Nurse when managing the care of the surgical patient.

NURS 462 Psychotropic Drugs and Children/Adolescents (1)
Study of psychotropic medications used to treat children and adolescents, including indications, actions, adverse reactions and implications for school nurses.

NURS 463 Compassionate Counseling for Children/Adolescents Dealing with Dying, Death, Other Life Crises (3)
Explores
issues involving dying, death and life crises which occur in today’s world and affect school communities.

**NURS 463 Compassionate Counseling for Children/Adolescents Dealing with Dying, Death, Other Life Crises (3)**

This course is part of the school nurse series. The school nurse series is anticipated to be offered in the summers throughout PA by Penn State Outreach: Professional and Organizational Development and the School of Nursing as an outreach mission. This course explores the complex issues involving death in today’s world as faced by children and adolescents. Content includes: counseling skills for nurses; child and adolescent development in the understanding of dying, death, and other life crises; exploring dying, death, and crises that are present in the lives of children and adolescents in the modern world; discussions of risks of death in the modern world including suicide, accidents, disasters, violence, war, and communicable diseases; description of death rituals and how societies cope with dying and death; identifying effective strategies to assist children and adolescents in coping with dying, death, and other life crises. The societal and school issues that affect not only an individual student but the milieu of the school and other students, parents, teachers, advisers, and administrators are inherent in the content. This course expands knowledge and interventions for those working with children and adolescents in the school setting. Presentations and examinations compose the evaluative methods.

**NURS 465 Health Concepts for Adults with Complex Health Care Needs (3)**

In-depth study and application of the theoretical principles and roles of adult clients and families with complex healthcare needs.

**NURS 465 Health Concepts for Adults with Complex Health Care Needs (3)**

NURS 465 focuses on the application of those concepts that relate to the adult high-risk client, family, or significant other in a complex health care setting. Course prerequisites include Introduction to Computing and Nursing Informatics and Transition and The Professional Nursing Role. The student selects a clinical nursing practice experience related to complex health care of the adult high-risk client and, based on course objectives, develops clinical practice objectives in collaboration with the course faculty. Evaluation of the course is by grading of written assignments and achievement of clinical nursing practice objectives. The course is offered in fall and/or spring semesters of the senior year. Upon completion of this course, the student will be able to: 1. Integrate theory and knowledge of nursing and related disciplines as a basis for professional nursing practice with adult high-risk clients. 2. Demonstrate interpersonal skills to support and guide clients/families/significant others in the selection of appropriate health patterns. 3. Utilize the nursing process to analyze complex adult high-risk situations occurring in acute care, transitional care, and/or community settings. 4. Apply critical thinking skills to clinical nursing practice situations involving the high-risk client/families/significant others. 5. Collaborate with colleagues in the design, implementation, and evaluation of nursing interventions. 6. Demonstrate in the clinical nursing practice setting the role of the professional nurse as case manager, change agent, advocate and researcher with the adult high-risk client/families/ significant others. 7. Demonstrate a comprehensive understanding of opportunities for clinical nursing research with the adult high-risk client/families/significant others. 8. Demonstrate nursing practice within the legal and ethical guidelines for professional nursing practice with the adult high-risk client.

**NURS 467 Medication Update and Health Teaching Interventions for School Nurses (1)**

Study of current pharmacologic concepts, including health teaching, prescribed for acute and chronic conditions commonly encountered in school nursing.
The course addresses the current pharmacologic therapies and related health teaching that school nurses commonly encounter in the student population. The most commonly used medications in the school-age student include the following categories: the Respiratory System, the Central Nervous System, the Cardiovascular System, the Digestive System, the Endocrine System, the Dermatologic System, and medications used to treat and prevent infections/infestations. Upon completion of this course, the student will be able to identify the classifications of commonly used medications; discuss the pharmacologic treatment of specific ambulatory pediatric health problems; develop patient teaching plans for students taking medications.

Teaching strategies may include lecture, discussion, audiovisuals, and selected readings.

**NURS 468 Client Education Strategies for Nurses and Other Health Care Providers (3)**  
Explores current and emerging roles of client education in the knowledge era.

This course explores current and emerging roles of client education in the knowledge era. Emphasis is placed on the application of teaching and learning strategies that deliver empowering and engaging health education to promote wellness, prevent health problems, and manage chronic illness. Upon completion of this course, the student will be able to:

- assess the challenges and issues facing nurses and health care providers enacting the role of client educator in the knowledge era; explore the promotion of client health at all levels of prevention: primary, secondary, tertiary; integrate the client education process for individuals, families, groups, and communities; assess learner motivation, readiness, and situational impacts such as psychosocial factors and cultural beliefs that affect the client education process; implement sound, effective teaching and learning strategies in selected clinical settings with special populations; develop teaching plans using taxonomies of educational objectives; select specific teaching strategies and delivery systems, including technology, appropriate for the developmental stage and needs of the learner; describe methods for evaluation of teaching; identify appropriate communication and documentation of the process and outcomes; and list topics in client education which can be further explored through research.

This course may be used as a nursing elective or by nurses or other health care workers to increase knowledge and promote successful health teaching to clients. Continuing education has been the delivery mode, plus it has been offered at other campuses through the school of nursing. The course could be with approximately 20 – 30 students. This course has been run through continuing education last semester.

Overview of autism spectrum disorders including resources related to children with autism spectrum disorders.

**Autism Spectrum Disorders: Care Overview (1)**

In this course, Bullying: Identification and Intervention, students will explore the impact of bullying on individuals, schools, teachers, families, of the target and the bully. Details of cyber-bullying are included. Students will review current research findings on bullying including witnesses/bystander behavior and factors contributing to the behaviors. The use of screening and assessment tools for prevention along with early identification will be emphasized to help students understand the steps a professional may take in these situations. Students will learn methods of prevention and intervention. Finally, the reporting of bullying and legal and ethical issues will be analyzed.

**NURS 475 Integrated Concepts in Nursing Practice (3)** Project-based capstone course for application of nursing concepts to health promotion/disease prevention in populations.

**NURS 475 Integrated Concepts in Nursing Practice (3)**

NURS 475 is a project-based capstone clinical course with a focus on the application of nursing concepts. The course is designed to provide opportunity for students to synthesize and apply the art and science of nursing to health promotion and disease prevention in culturally diverse populations in varied clinical settings of the global community. Upon completion of this course, the student will be able to synthesize knowledge from nursing and related sciences for application to evidence-based nursing practice; interpret legislative and regulatory processes relevant to the capstone project; collaborate with members of the health team to provide continuity of care through appropriate communication, consultation, and referral; communicate effectively using written, verbal, nonverbal and emerging technology methods; apply biostatistical, epidemiological, and research findings to enhance the delivery of evidence-based nursing care; provide evidence-based nursing care that contributes to safe and high quality patient outcomes within healthcare Microsystems; participate in the development and implementation of theory-based and a population-focused health promotion project; facilitate change in the healthcare Microsystems affecting the provision of nursing care to diverse populations throughout the lifespan; demonstrate accountability in the delivery of professional nursing care; and integrate the concept of life-long learning into professional nursing practice. Teaching strategies include: seminar discussions, population-based nursing practice project and preceptored nursing practicum. NURS 475 is the final nursing course and contributes to craft future nursing career goals for RN to BS students.

**NURS 492 Emergency Care and Safety (3)**

A comprehensive first aid course designed to provide knowledge of prehospital emergency care at the First Responder level.

**NURS 492 Emergency Care and Safety (3)**

NURS 492 is a comprehensive emergency care and safety course that incorporates basic first aid skills and knowledge and advanced topics such as oxygen therapy, hazardous materials, farm/rural incidents, disaster planning, incident command, triage, and mass casualty incidents. The course includes discussion of infectious diseases and the standard precautions utilized by rescuers to prevent the transmission of disease. Critical thinking and decision-making skills are utilized throughout NURS 492 in practical exercises using various scenarios to enhance the rescuers response in emergency situations. Students are evaluated by written examination and practical skill testing. Cards in First Aid/Emergency Care and CPR for the Healthcare Provider/Professional CPR will be issued to the student upon successful completion of the course. NURS 492 is a complimentary course to NURS 203, which is a basic first aid/community CPR general education elective course designed for the non-nursing major who is required to have first aid/CPR certification for their course of study. NURS 492 provides the student an alternative to NURS 203 by providing emergency care at a higher level of training. NURS 492 is an excellent course for nursing students with advanced health care knowledge, community health care providers (i.e., school nurses), and any non-nursing major interested in emergency medical services (i.e., Kinesiology). NURS 492 is offered fall and/or spring semesters and enrollment is limited to 30 students. The course objectives follow.

Upon completion of this course, the student will be able to:

a. Recognize and state signs and symptoms of both non-urgent and life-threatening illnesses and injuries.

b. Demonstrate an ability to treat injuries and illness until Emergency Medical Service (EMS) help arrives by utilizing critical thinking skills to make correct decisions, integrate knowledge and improvise materials as necessary.

c. Demonstrate the correct procedure of CPR for the Adult, Child, and Infant victim of cardiac arrest, including Obstructed

The Pennsylvania State University
Airway.
d. Recognize the special cultural and technical barriers of providing first aid in a rural setting and a farm environment.
e. Demonstrate an awareness of hazardous materials at a first responder level of competency.
f. Demonstrate appropriate triage decisions in single or multiple person accidents.
g. Demonstrate an awareness of primary and secondary prevention of trauma, especially with farming incidents.
h. Demonstrate an awareness of safety by conducting a safety inspection of the home or work place.
i. Design and plan a shelter for victims in the event of a man-made or natural disaster.

Diversity: None
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 496A NURS 496A Graduate Nurse Residency 1 (1) This course is designed to support newly graduated nurses in their development as professional nurses and members of the health care team. This course covers a portion of the content from the UHC/ANCC Nurse Residency program through monthly seminars on: critical thinking skills, leadership development, communication strategies and patient safety. Sessions will be 2.5 hours in length.

NURS 496A Graduate Nurse Residency 1 (1)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014 Ending: Summer 2014
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 497 Special Topics (1-9) Formal courses given infrequently to explore, in depth, a comparatively narrow subject which may be topical or of special interest.

Special Topics (1-9)
NURS 497A Business of Nursing (3) Teaches students basic business principles as they apply to nursing and health related entrepreneur.

Complexity Science, Health, and Education (3)

Human Diversity Among School-Aged Youth (2)

Development of Personality Disorder Traits: School Youth Through Young Adult (1)

Neurological Assessment Skills for the School Nurse (1)
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 498 Special Topics (1-9)**

Formal courses given infrequently to explore, in depth, a comparatively narrow subject which may be topical or of special interest.

**Special Topics (1-9)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 499 (IL) Foreign Study--Nursing (1-9)**

Study of nursing issues in a foreign country.

**Foreign Study--Nursing (1-9)**

General Education: None
Diversity: IL
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 501 Issues in Nursing and Health Care (3)**

Analysis and evaluation of the health care system with emphasis on health policy and economic issues affecting nursing practice.

This course will focus on the state of the U.S. health care system within global, health policy, and economic perspectives. The course will cover current and complex issues and trends specific to nursing, and in the broader context of interdisciplinary health care. Master’s level nurses will develop beginning mastery over the concepts and principles of health care policy, and the leadership skills necessary to influence policy changes in health care within organizations and on a national, state or local level.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 502 Advanced Health Assessment of Adult Populations (3)**

Advanced nursing assessment and diagnosis of physical, psychosocial and developmental health for adults and families across the adult age spectrum.

**Advanced Health Assessment of Adult Populations (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2012

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 502A Advanced Health Assessment of Pediatric Populations (1)**

Advanced nursing assessment and diagnosis of physical, psychosocial and development health for individuals and families across the pediatric age spectrum.

**Advanced Health Assessment of Pediatric Populations (1)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2011

Concurrent: NURS 502

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 503 Pathophysiology (3)**

Integration of advanced physiology, genetics, and pathophysiology as related to specific
disease entities and alterations in functioning.

Pathophysiology (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 504 Pharmacologic Therapy (3) Use of pharmacologic therapies in advanced practice nursing.

NURS 504 Pharmacologic Therapy (3)

This course is designed to meet the needs of the advanced practice nurse prescriber in the primary and other healthcare settings, building upon previously, and/or concurrently acquired knowledge from nursing, pathophysiology, and affiliated sciences. The development of clinical decision-making skills essential to safe and effective pharmacologic intervention is the focal point of the course. Current concepts in pharmacologic therapies as part of the treatment of health problems will be stressed.

Upon completion of the course, the student will be able to:
1. Understand the clinical use of broad categories of medications in provision of primary, secondary, and tertiary care.
2. Describe the dose-response relationship of medications commonly used in the practice setting.
3. Define pharmacologic concepts and principles relevant to the use of medications in the practice setting.
4. Analyze the impact of client motivation in seeking and adhering to medical prescriptions, with focus on the special needs of rural and medically underserved populations.
5. Individualize the prescription of drugs to meet client needs.
6. Discuss economic considerations in prescription of medications, including the special needs of rural and medically underserved clients.
7. Develop teaching strategies for use in special populations.
8. Consider the legal aspects of advanced practice, focusing on the needs of an advanced practice nurse.

This is a required course for all nurse practitioner students before all Nurse Practitioner Practicum courses. It may be chosen as an elective course by students in other nursing specialty areas. This course fulfills the pharmacology requirement for licensed nurse practitioners to earn prescriptive authority from the Pennsylvania State Board of Nursing. Evaluation methods include examinations (case studies and multiple choice objective tests), a case presentation, and class participation.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008 Ending: Summer 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 508 Perspectives in Population-Based Health (3) Theories and strategies for promoting health in community aggregates with emphasis on vulnerable and underserved populations of diverse backgrounds.

Perspectives in Population-Based Health (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2008

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 510 Theoretical and Scientific Foundations of Advanced Nursing Practice (3) Examines the relationship of nursing theories to the development of nursing science, as well as current scientific advances that guide nursing practice and research.

Diversity: None
Bachelor of Arts: None

The Pennsylvania State University
NURS 512 Nursing Research (3) A nursing research course with emphasis on research design, data collection methods, and evaluation of research studies.

NURS 512 Nursing Research (3)

Nursing 512 is a research course designed to build on nursing theory taught in Nursing 510. This course provides students with an overview of the role of nursing research in the development of nursing practice as well as sound ethical principles related to the conduction and utilization of nursing research in all areas of health care. Principles guiding the conduction, application and utilization of both qualitative and quantitative studies will be emphasized. Nursing 510 is a prerequisite for the course. Nursing 512 will be offered in the Spring semester and is taken in the second semester of full-time study.

NURS 522 Comprehensive Assessment of the Older Adult (3) In-depth assessment of biological, physical, clinical, functional, cognitive, psychological, and social changes associated with aging.

NURS 522 Comprehensive Assessment of the Older Adult (3)

This course provides an in-depth interdisciplinary assessment of the biological, physical, clinical, functional, cognitive, psychological, and social changes associated with aging. Students will be provided with foundational information about the process of aging along with a global perspective on aging. The primary focus of the course is an assessment of the unique issues encountered by the older adult. Legal, financial, and other economic concerns will also be explored.

**NURS 527 Promoting Healthy Lifestyles in the School-Age Population (3)**

This course will focus on promoting healthy lifestyles for the school age population. The most prevalent health problems of the school age population include issues of physical inactivity, nutrition, and obesity; physical health problems of asthma, diabetes, and attention deficit hyperactivity disorder; and mental health problems of depression, eating disorders, and substance abuse. This course provides a broad overview of these health problems and discusses the role of the school nurse as a partner with families to promote a healthy lifestyle for the child.

NURS 834 Doctor of Nursing Practice Clinical Practicum (1-4 per semester/maximum of 8)

The focus of the clinical practicum is planning, implementing, and evaluating evidence-based interventions to address a healthcare problem.

Doctor of Nursing Practice Clinical Practicum (1-4 per semester/maximum of 8)
Note : Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**NURS 835 Doctor of Nursing Practice Capstone Project (2-3 per semester/maximum of 10)**

The Doctor of Nursing Practice capstone project demonstrates clinical scholarship in an area of practice.

**NURS 840 Nursing Education Theories and Strategies (3)**

Theoretical foundation and evidence-based strategies for nursing education.

This course provides a foundation in the role of the nurse educator and evidence-based strategies for nursing education. Students will explore various theoretical perspectives of teaching and learning, as well as practical application of strategies to meet the diverse needs of learners. The course is intended to prepare students to employ effective teaching strategies in classroom, clinical, and on-line educational settings. Discussion of managing various challenges related to nursing education will be included throughout the course.

**NURS 841 Assessment and Evaluation in Nursing Education (3)**

Methods for assessment, measurement, and evaluation of student learning in academic and clinical settings.

This course provides a foundation in assessment, measurement, and evaluation strategies for nursing education. Students will explore the theoretical basis for evaluation, as well as practical application of the strategies. The course is intended to prepare students to utilize strategies of measurement and evaluation in developing tests, interpreting test results, assessing clinical performance, and evaluating written assignments. Discussion of legal and ethical issues related to evaluation in nursing education will be included throughout the course.

**NURS 842 Curriculum and Program Development in Nursing Education (3)**

Curriculum design and evaluation, educational program development, and accreditation.

This course provides a foundation in curricular design, program development, and curriculum evaluation in nursing education. Students will explore internal and external contextual factors influencing curriculum design and implementation. This course is intended to prepare students to utilize foundational principles and concepts for the development and evaluation of nursing curricula in academic settings. This course will also prepare students for program development and evaluation in nursing education.
NURS 843 Synthesis and Application of the Nurse Educator Role (4) Practicum in the application of the nurse educator role in academic and healthcare settings.

This course involves the practical application of knowledge acquired in previously completed courses related to nursing education. Students will work with a preceptor in an educational setting to demonstrate multiple aspects of the nurse educator role. The practicum experience will be developed to fulfill mutually agreed-upon objectives based on students’ previous experiences and identified learning needs.

Healthcare Economics and Policy for Nurse Administrators (3)

This course provides a foundation in healthcare economics and policy for nurse administrators. Students will explore the theoretical basis of leadership and change, as well as analyze organizational structure, power, and politics. This course is intended to provide students with a theoretical and evidence-based foundation for leadership roles within health care organizations. Discussion of communication, decision-making, and problem-solving strategies for nurse administrators is included throughout the course.

Leadership Concepts and Theories for Nurse Administrators (3)

This course provides a foundation in nurse leadership roles, concepts, and theories. Students will explore the theoretical basis of leadership and change, as well as analyze organizational structure, power, and politics. This course is intended to prepare students to utilize leadership strategies for recruiting, retaining, developing, and evaluating a diverse, multidisciplinary work force in complex healthcare environments. Discussion of evidence-based strategies for conflict resolution will be included throughout the course.

Human Resource and Work Force Issues for Nurse Administrators (3)

This course provides a foundation in human resources within health care organizations. Students will examine ethical and legal issues related to collective bargaining, unions, and staffing. This course is intended to prepare students to utilize leadership strategies for recruiting, retaining, developing, and evaluating a diverse, multidisciplinary work force in complex healthcare environments. Discussion of evidence-based strategies for conflict resolution will be included throughout the course.
NURS 847 Human Resource and Work Force Issues for Nurse Administrators (3)

This course provides a foundation in human resources within health care organizations. Students will examine ethical and legal issues related to collective bargaining, unions, and staffing. This course is intended to prepare students to utilize leadership strategies for recruiting, retaining, developing, and evaluating a diverse, multidisciplinary work force in complex healthcare environments. Discussion of evidence-based strategies for conflict resolution will be included throughout the course.

NURS 848 Synthesis and Application of the Nurse Administrator Role (4)

This course involves the practical application of knowledge acquired in previously completed courses related to nurse administration. Students will work with a preceptor in a health care setting to demonstrate multiple aspects of the nurse administrator role. The practicum experience will be developed to fulfill mutually agreed-upon objectives based on students’ previous experiences and identified learning needs.
NURS 860 Adult Gerontology Acute Care Nurse Practitioner Role I (3)

Acute Care Nurse Practitioner role across the continuum of care with adults and older adults with complex acute, critical, and chronic health conditions to restore or maximize health.

NURS 860 Adult Gerontology Acute Care Nurse Practitioner Role I (3)

This course focuses on utilization of a collaborative approach to enhance Acute Care Nurse Practitioner effectiveness with restorative care and synthesis of theoretical, scientific, and clinical knowledge required for the assessment, diagnosis, management, and treatment options of patients with complex acute, critical, and chronic illness across the continuum of care. Content will focus on patients with acute and chronic cardiovascular, pulmonary, infectious disease, and nutrition problems, as well as related ethical, legal, and professional practice issues. This course is designed to be taken concurrently with the Adult Gerontology Acute Care Nurse Practitioner Practicum I (NURS 862) and is required for the Adult Gerontology Acute Care Nurse Practitioner Option within the Master of Science degree with a major in Nursing.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Future: Fall 2014
Prerequisite:
Concurrent: NURS 862

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 860 Adult Gerontology Acute Care Nurse Practitioner Role II (3)

This course continues the focus on utilization of a collaborative approach to enhance Acute Care Nurse Practitioner effectiveness with restorative care and synthesis of theoretical, scientific, and clinical knowledge required for the assessment, diagnosis, management, and treatment options of patients with complex acute, critical, and chronic illness across the continuum of care. Content will focus on patients with acute and chronic neurologic, gastrointestinal, renal, hematologic, and endocrine problems, as well as special topics. This course is designed to be taken concurrently with the Adult Gerontology Acute Care Nurse Practitioner Practicum II (NURS 863) and is required for the Adult Gerontology Acute Care Nurse Practitioner Option within the Master of Science degree with a major in Nursing.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Future: Fall 2014
Prerequisite:
Concurrent: NURS 862

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 861 Adult Gerontology Acute Care Nurse Practitioner Role II (3)

Continuation of Acute Care Nurse Practitioner role across the continuum of care with adults and older adults with complex acute, critical, and chronic health conditions to restore or maximize health.

NURS 861 Adult Gerontology Acute Care Nurse Practitioner Role II (3)

This course continues the focus on utilization of a collaborative approach to enhance Acute Care Nurse Practitioner effectiveness with restorative care and synthesis of theoretical, scientific, and clinical knowledge required for the assessment, diagnosis, management, and treatment options of patients with complex acute, critical, and chronic illness across the continuum of care. Content will focus on patients with acute and chronic neurologic, gastrointestinal, renal, hematologic, and endocrine problems, as well as special topics. This course is designed to be taken concurrently with the Adult Gerontology Acute Care Nurse Practitioner Practicum II (NURS 863) and is required for the Adult Gerontology Acute Care Nurse Practitioner Option within the Master of Science degree with a major in Nursing.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2012
Prerequisite:
Concurrent: NURS 863

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

NURS 862 Adult Gerontology Acute Care Nurse Practitioner Practicum I (4)

Adult Gerontology Acute Care Nurse Practitioner practicum with patients across the continuum of care with adults and older adults with complex acute, critical, and chronic health conditions.
NURS 862 Adult Gerontology Acute Care Nurse Practitioner Practicum I (4)

This is a comprehensive practicum in which students implement the Adult Gerontology Acute Care Nurse Practitioner role through application of theoretical knowledge and psychomotor skills taught in NURS 860 and all prior courses. Emphasis is given to development of advanced clinical competency and clinical decision making abilities. This practicum course for the Adult Gerontology Acute Care Nurse Practitioner option involves student rotations through clinical sites providing care for adults and older adults with acute and critical illness. Clinical conferences will enable students to discuss their unique clinical experiences and topics that emerge from their clinical practice. Minimum clinical conference time is 15 hours per semester.

NURS 864 Adult Gerontology Acute Care Nurse Practitioner Integrative Practicum (2-6 per semester/maximum of 6)

This is a comprehensive practicum in which students implement the Adult Gerontology Acute Care Nurse Practitioner role through application of theoretical knowledge and psychomotor skills taught in NURS 864 and all prior courses. Emphasis is given to development of advanced clinical competency and clinical decision making abilities. This practicum course for the Adult Gerontology Acute Care Nurse Practitioner option involves student rotations through clinical sites providing care for adults and older adults with complex acute, critical, and chronic health conditions.
and demonstrate synthesis of theoretical, scientific and contemporary clinical knowledge learned in all courses of the Adult Gerontology Acute Care Nurse Practitioner Option. This practicum allows the student to integrate the roles of the Adult Gerontology Acute Care Nurse Practitioner and demonstrate clinical competency and clinical decision making abilities. The setting for clinical rotation may include any acute or critical care area and may be chosen based on the student's preferred specialty area. Clinical conferences will be utilized to discuss clinical issues identified by students from their specific sites, synthesize all previously learned knowledge, and discuss role development. Minimum clinical conference time is 15 hours per semester.

Bachelor of Arts: None
Effective: Summer 2012
Prerequisite:

NUTR 421 (US;IL) Food Culture and Health Trends (3) Social-political, historic, and geographic roots of food patterns, featuring specific cuisine areas and nutritional disease patterns; includes foods laboratory.

NUTR 421 Food, Culture, and Health Trends (3)
(US;IL)

Food, Culture, and Health Trends is a survey of the development of cuisine, and of ethnicity and health patterns as they are expressed through food and cuisine. This is also a laboratory course, where each week representative foods from diverse cultures are experienced, prepared by the students into dishes representative of the cuisine, and then consumed. The first third of the course follows the development of food patterns from hunter gathering and agricultural development through trade, conquest, and the globalization of foods. The second two thirds examines particular cuisine clusters as they have affected US food patterns. The course focuses on the physical, historical, social-political, and cultural factors that affect food choice in a specific area, such as geography, colonization, trade, migration, slavery, and religion. The nutritional outcomes of today’s cultural food patterns, specifically the epidemiology of nutrition-related diseases, is another focus, particularly how cultural groups adjust to the US diet. The objectives of the course are to create an appreciation and understanding of the diverse origins, changing nature, and strengths of traditional cuisines, the nutritional problems arising from cuisine transitions, and a respect for the role of food in cultural expression. This course provides the cultural awareness needed by dietitians and any student of food and culture to participate in dietary exploration and change. Evaluation methods include weekly essay quizzes, laboratory participation and performance, 5 group activities, 2 essay tests, and a group library, web and informant based evaluation of one culture’s cuisine. Two sections are offered each Spring Semester. Enrollment is limited to 36 students per section.

NUTR (S T S) 430 Global Food Strategies: Problems and Prospects for Reducing World Hunger (3)
(IL)

BA This course meets the Bachelor of Arts degree requirements.

Global Food Strategies examines opportunities for the world’s poor to improve their health, nutrition, and physical environment by focusing on their own cultural strengths and organization, reassessing the opportunities within their environment, evaluating the appropriateness of new and old technologies, and gaining a renewed respect for their own abilities. Measures of appropriateness used throughout the course are ecological sustainability and cultural sensitivity. Approximately one third of the course focuses on the historical basis of underdevelopment up to and including the
The second two thirds focuses on micro-strategies for poverty alleviation. Topics include culturally-appropriate people centered development women's empowerment needs including microlending (small loans), the prospects and rationales for biological agriculture vs. industrialized agriculture, successful models of health and population control, the impact of American consumerism, and ecological footprint analysis. The goals of the course are to 1) awaken the student's interest in hunger and poverty issues and the cultural dimensions of poverty, 2) acquaint the student with viable and sustainable strategies for hunger and poverty alleviation for the very poor, and 3) enable the student to understand enough about globalism that he/she can critically analyze and evaluate international affairs articles in national newspapers. The classes integrate lecture information with films that help with the visualization of poverty problems and prospects, readings, current events, and small group discussion around issues and case studies. Readings are drawn from development classics and from a wide range of recent literature on poverty and change. Evaluation includes student responses to three essay tests posed by the instructor over the semester, and journal keeping. The class project is designed to promote citizenship/leadership skills. Students will make a contract to perform a particular citizen action relating to hunger and poverty alleviation, which they will describe in an oral report and written format. Participation is evaluated. The class is offered fall semester only. Enrollment is limited to 60 students.

**NUTR 456** (US) Community Nutrition (3) Programs and policies of nutrition-related activities of community agencies; factors pertinent to nutrition education; relationship of cultural and social identity to foods and nutrition.

**NUTR 456 Community Nutrition (3)** (US)

Programs and policies of nutrition-related activities of community agencies; factors pertinent to nutrition education; theory and practice of community nutrition within the dietetics, nutritional sciences, and public health nutrition professions; emphasis on differences in United States values, traditions, attitudes, beliefs and customs and United States social identities in relation to one another within a community-based framework.

This course provides knowledge in the content area of community nutrition which is tested on the national registration examination for registered dietitians.

Students are evaluated based assessments designed to increase personal cultural awareness and sensitivity, literacy level of nutrition education materials, credible resources for nutrition information, community needs assessment and community nutrition intervention programming and assessment. In particular, the assessment of a community’s nutritional needs and the design of a nutrition intervention serve to highlight the cultural diversity within the United States and increase the student’s ability to locate and evaluate information about nutrition and food practices of diverse groups living in the United States. Students will focus on immigrant groups, ethnically- or racially-diverse groups, Native American tribes or loosely affiliated groups of people who have common socioeconomic status or food practices or food patterns (e.g., poverty, food insecure with/without hunger, vegans, vegetarians, Kosher).

Community nutritional needs assessment and interventions assignments also serve to assess whether the United States cultures objectives of this course are successfully met. In addition, each assignment requires that students consider cultural and socioeconomic factors as determinants of diet, nutritional status and health status.

**Maternal and Child Nutrition (3)**

This course is designed to provide an understanding of the nutritional recommendations during preconception, pregnancy, lactation, early infancy, and childhood. In this course, students will acquire a broad understanding of the role and regulation of nutrient metabolism and effects of genetic variation on nutritional needs during these unique physiological periods. These concepts will be discussed from molecular, clinical and applied perspectives that will guide further graduate-level inquiry. Lectures and readings will explicate 1) how nutrient metabolism affects pregnancy outcomes, lactation efficiency and infant development; 2) how nutrition affects common early childhood conditions, such
as obesity, allergy and autism; 3) how fetal/postnatal nutrition affects long-term health; and 4) the role of genetics in nutritional requirements during these times in the lifecycle. Students will gain an appreciation for the contribution of nutrition during the fetal/postnatal periods on long-term health and the incidence of disease through understanding the role of nutrients in a translational framework.

Obst/Gynecology-Hy (OBGYN)

OBGYN 700 Obstetrics and Gynecology (10) Required clerkship providing supervised clinical experience in obstetrics and gynecology.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Winter 1978
Prerequisite:

ObGYN 701 OBGYN Externship/Subinternship (5) An elective to provide advanced clinical experience involving community hospital OB/GYN, ambulatory OB/GYN, or selected subspecialties.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 1985
Prerequisite:

ObGYN 710 Clinical Gynecologic Oncology (5) Active participation in evaluation and management of patients with gynecologic malignancies.

Clinical Gynecologic Oncology (5)
OBGYN 720 Ambulatory and Adolescent Gynecology Elective (5) This course involves active participation in a community outpatient obstetric and gynecology practice.

Ambulatory and Adolescent Gynecology Elective (5)

OBGYN 720A Reproductive Endocrinology & Infertility Elective (2.5) This course provides exposure to basic concepts of diagnosis and management of infertility, and of reproductive endocrinologic disorders of women including hyperandrogenicity and anovulation.

OBGYN 720A Reproductive Endocrinology & Infertility Elective (2.5)

This course is designed to introduce third year medical students to the basic evaluation of human infertility, and expose them to current technologies for addressing the problem. Additionally, students will be introduced to clinical reproductive endocrinology in women, including the underlying biochemical and hormonal basis of normal function, and the recognition and management of common disorders. This will include exposure to genetic and clinical research, and the interplay between what are seen as reproductive endocrine disorders and broader human endocrinology. Experiences will include participation in infertility clinics, endocrinology clinics, vaginal ultrasound sessions, and egg retrieval and embryo transfer procedures.

OBGYN 721 Clinical Endocrinology/Infertility (5) Active participation in evaluation and management of outpatient/endocrinology/ infertility problems.

Clinical Endocrinology/Infertility (5)

OBGYN 722 Clinical Perinatal Medicine Elective (5) Management of women with pregnancies complicated by maternal and/or fetal disease will be learned in a high-risk pregnancy environment.

Clinical Perinatal Medicine Elective (5)

OBGYN 722A Perinatology Elective (2.5) This course provides exposure to basic concepts of management of high risk pregnancies and medical complications of pregnancy.

OBGYN 722A Perinatology Elective (2.5)
This course is designed to introduce third year medical students to the basic concepts of high risk obstetrics, and expose them to current technologies for monitoring fetuses and diagnosing prenatal disorders. They will review the human physiologic adaptations of pregnancy, and understand the relevance to everyday clinical situations. They will be exposed to genetic counseling, screening, and diagnosis, including the ethical impact of current knowledge and technologies. Finally, they will be exposed to the impact of pregnancy on systemic disorders, such as hypertension, and the impact of those disorders on the health and development of the fetus.

Prerequisite: None

**Note:** Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PED 710A Pediatric Hematology/Oncology Elective (3rd year) (2.5)** This course provides exposure to the pediatric cancer patient and the field of Pediatric Oncology by closely following several patients through their full range of illness experiences.

**PED 710A Pediatric Hematology/Oncology Elective (2.5)**  
This course is designed to introduce third year medical students to the field of Pediatric Oncology in a unique way. Students will be assigned selected patients under treatment for cancer or hematologic disease. Students will follow these patients and their families closely for the 2-week selective, but in addition to focusing on the medical care, the student will follow each patient through his or her entire experience. The student will be expected to research the primary disease and other medical issues of their assigned patients, attend daily rounds, and will also accompany and observe the patient through experiences related to their illness. These may include diagnostic tests, physical therapy, dietary, pharmacy, social work contact, play activities, and clinic visits and home visits if the patient is discharged. The student’s experience will require contact with multiple consultants and departments involved in the care of their patients, including physicians, nurses, pharmacists, the team psychologist, teachers, social workers, child life, dieticians and others. Each student will meet at least weekly to discuss the assigned patients with one of the Pediatric Hematology/Oncology attendings and with the team psychologist. Rather than write daily notes, the student will keep a journal and prepare a written or oral presentation on at least one of their patients.  
The overall goal of the elective is to allow students to appreciate the scope of Pediatric Hematology/Oncology through the eyes of the patient and the entire medical team. This unique approach should lead the student to integrate knowledge and gain insight into the medical field not available through any other rotation.  
Evaluation will be by faculty but may include comments by the patients, their families, and other members of the medical team, as well as the quality of the student's final presentation.

**PED 745 (SURG 745) Pediatric Cardiothoracic Surgery Elective (5)**

This fourth-year elective provides an introduction to the operative repair and peri-operative management of simple and complex congenital heart disease.

**PED (SURG) 745 Pediatric Cardiothoracic Surgery Elective (5)**

This elective in pediatric cardiothoracic surgery is offered to fourth-year medical students with an interest in congenital heart disease. It is principally targeted at students who plan a career in pediatrics, surgery, or pediatric or adult cardiology. The course is offered year-round on a monthly basis, with enrollment limited to 1-2 students per rotation. Students will work exclusively with attending surgeons in the clinical environment, and will participate in the comprehensive surgical management of infants, children, and adults with congenital heart disease. Clinical exposure will be provided to the initial surgical consultation, the judgment and rationale for operative versus non-operative management, the preoperative family counseling meeting and informed consent process, and the formulation of the operative plan. In the operating room, students will second-assist with pediatric heart surgery and will gain first-hand appreciation of the anatomic defects and their surgical repair. Postoperatively, students will participate in clinical rounds on pediatric heart surgery patients, and will follow the patients to discharge. The elective will emphasize the multi-disciplinary approach to the management of congenital heart disease, with collaborative exposure to pediatric cardiology, pediatric critical care, cardiac anesthesia, and cardiology for adults with congenital heart disease. Didactic lectures, case presentations, and reviews will be provided to students as an introduction to the major heart defects. Students will gain skill in the interpretation of echocardiograms, and will have the opportunity to view, in real-time, intraoperative transesophageal echo images, and correlate those images to the live, beating heart. Students will also gain skill in interpretation of cardiac MRI and CT angiography. The course is offered as an elective for students seeking an advanced introduction to surgery for congenital heart defects. The course is not intended as an acting-internship; thus, there is no in-house call, and limited night or weekend clinical requirements. A pre-test and a post-test will be administered.

**PED 747 (MED 747) Pediatric Allergy, Asthma and Immunology Elective (5)**

This course provides exposure to basic concepts for diagnosis and management of children and adults with allergic and immunologic diseases and respiratory and cutaneous abnormalities.

**Pediatric Allergy, Asthma and Immunology Elective (5)**

General Education: None

**PED 750A Pediatric Nephrology Elective (3rd year) (2.5)**

This course provides exposure to basic concepts for diagnosis management of children with kidney disease or fluid/electrolyte abnormalities.
PED 750A Pediatric Nephrology Elective (2.5)

This course is designed to introduce third year medical students to the basics of evaluation and management of children with kidney disease or hypertension, and to specifically to solidify skills gained in fluid and electrolyte management during the third year core clerkships including Pediatrics or Medicine, and in the year II Renal block. Students on this elective will serve as an integral part of the Pediatrics Nephrology team, personally evaluating and discussion management of patients on the inpatient, consult, and outpatient Pediatric Nephrology services. Didactic experiences will include daily, one-on-one discussions with the attending physician(s) on the Pediatric Nephrology service. Students will be expected to demonstrate evidence of independent reading in Pediatric Nephrology topics, and to attend scheduled Pediatric Nephrology and selected Pediatrics conferences.

The overall goal of this elective is to allow students to attain the basic skills and knowledge necessary for initial evaluation of common Pediatric Nephrology problems encountered in primary care and in-patient pediatrics settings. Focus will be placed on review of renal physiology as it pertains to patient care, and to fluid and electrolyte management. Students will also be encouraged to hone their skills in obtaining a pediatric history and performing a pediatric physical exam.

Evaluation methods will include a pre-test and post-test as well as subjective evaluation of students' funds of knowledge and patient care skills by the attending pediatric nephrology faculty. This course will be offered throughout the entire academic year.

**PERSP 982** Economic Analysis of Law (3) This course will introduce students to the economic analysis of law and legal
issues. No prior training in economics is assumed, though students with such training are welcome to enroll. Students will
be instructed in the nature of economic reasoning and will learn to use fundamental principles of economics to explain
legal doctrines and solve legal problems. The course will focus primarily on a positive analysis, investigating whether legal
doctrines can best be explained as attempts to promote efficiency, and only secondarily on the normative question of
whether law ought to promote efficiency. After a brief survey of microeconomics, the course will address the major
common law areas of property, contracts, torts, and criminal law as well as the legal process.

Petroleum and Natural Gas Engineering (P N G)

P N G 405 Rock and Fluid Properties (3) Reservoir rock properties, rock and fluid properties (interaction between rock and fluids), flow behavior in reservoir, and fluid properties.

P N G 405 Rock and Fluid Properties (3)

The objective of this course is to introduce students to basic reservoir rock and fluid properties. The course is divided into three sections: rock properties, rock and fluid properties (interaction between rock and fluids), and fluid properties. In the rock properties, Lithology of Reservoirs, Porosity and Permeability of Rocks, Darcy's Law, and Distribution of Rock Properties are discussed. In Rock and Fluid Properties Section, Existence of Multi-phases, Saturation, Wettability, Capillary Pressure, Effective and Relative Permeability, concepts are covered. Fluid properties topics include Phase Behavior of Single and Multi Component Systems, Compositional and Black-Oil models, Solution Gas-Oil Ratios, Formation Volume Factor, Compressibility, Density, Viscosity, and Interfacial Tension. This is also the first course that Petroleum and Natural Gas Engineering students take in the major. Therefore, an introduction to petroleum and natural gas engineering is also made.

This course is a pre-requisite for most of the Petroleum and Natural Gas Engineering major courses. It is an elective course for majors such as Environmental Systems Engineering. It is offered every Fall semester.

P N G 411 Introduction to Petroleum and Natural Gas Extraction (1) Introduction to the design and implementation of the systems used in the extraction of oil and gas. Not intended for petroleum and natural gas engineering majors.

Introduction to Petroleum and Natural Gas Extraction (1)
**P N G 420** Applied Reservoir Analysis and Secondary Recovery (4)

Application of material balance equations/transient flow solutions to water influx problems; displacement theory as it applies to design/behavior of flooding.

This course addresses two major issues in petroleum engineering: water influx and water flooding. The displacement of oil or gas by water is a complicated physical process that has a great impact on recovery efficiencies. The first objective of the course is to merge the material balance method and transient flow solutions for the aquifer into one analysis tool for understanding and predicting water influx cases. Several analytical and numerical methods are presented including: linear and radial diffusion equation solutions, super position, Hurst simplified, Schilthuis and Hurst modified. The material is followed by an analysis and design project that focuses on a field in the Gulf of Mexico.

The second objective of the course is to understand the fundamentals of displacement theory and practice. The extension of the Buckley and Leverett water flooding theory is presented for three-phase flow. Three-phase relative permeabilities are determined from experimental data. Several geometrical patterns are discussed in the course including: five spots, staggered line drive, direct line drive, four spots, seven spots, and nine spots. The efficiency of each pattern is determined. Strategies for selecting a pattern for special cases are presented. The behavior of each pattern with time, including oil recover, is an integral part of the course.

The students use our computational facility throughout the course. They write material balance models and use large reservoir simulators for studying water influx cases.

**P N G 425** Principles of Well Testing and Evaluation (3)

Mathematical basis for pressure analysis. Theory and practice of pressure testing techniques.

**Reservoir Modeling (3)**

The numerical simulation of petroleum reservoir processes by the use of models; scaling criteria and network flow.

**Formation Evaluation (3)**

Study of those methods used to evaluate the engineering properties of oil and gas bearing reservoir formations.
Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

P N G 480 Production Process Engineering (3) Analysis and evaluation of surface production processes, fluid separation, storage, measurement, treating, custody transfer, transmission, disposal, corrosion, and other operations.

P N G 480 Production Process Engineering (3)

Surface production engineering involves the extraction of reservoir fluids, their treatment at the surface and movement to a commercial market via a common carrier. It is the primary objective of this course to provide the fundamentals of surface production operations and underlying operational principles and design criteria for equipment utilized in the surface handling of petroleum production fluids. Surface production facilities are described in detailed as systems in charge of the separation of the wellstream fluids into three single-phase components (oil, gas, water) and of their transport and processing into marketable products or their disposal in an environmentally acceptable manner. A detailed overview of hydrocarbon fluid behavior, analysis of hydrocarbon and water separation processes, analysis and design of surface transportation systems and flow assurance problems is provided along with a comprehensive look at the engineering aspects involved in surface production operations. Topics include purpose and description of onshore and offshore surface production facilities and the function of the equipment used in these processes, including wellheads and Christmas trees, gathering systems, production manifolds, field processing of crude oil, field processing of natural gas, phase separation of gas, oil and water, water-in-crude oil emulsification, heater-treaters and dehydration of crude oil, natural gas dehydration, stock tank batteries and transportation. Discussion includes oil and gas quality checks, oil and gas metering, typical contractual hydrocarbon sales specifications, and typical specifications for produced waters and other by-products. Hydrocarbon fluid behavior topics includes an overview of hydrocarbon thermodynamics, hydrocarbon PVT behavior, thermodynamics of liquid and vapor separation, and fluid behavior prediction models including modern cubic equations of state. In the context of surface facility design, a process simulation or compositional simulation is implemented to predict how the components the make up the well fluids react to changes in pressure and temperature as they are processed through the facility through a succession of phase changes where liquids flash to vapor or vapors.
condense into liquid. Equipment design topics comprise design of 2-phase and 3-phase vertical and horizontal separators, derivation of design equations, design of crude and condensate stabilization trains, design and operation of glycol dehydrator towers, and flow assurance topics such as hydrate, corrosion, and wax prevention. The ultimate purpose of surface equipment design is to recommend the most suitable and cost-effective equipment type and size that meets the specified service and system condition, contractual obligations, and industrial health and safety and environmental regulations.

**P N G 482 Production Engineering Laboratory (1)**

The task of production engineers is to optimize the extraction, treatment and delivery rate of hydrocarbons. For this optimization to be realistic, quantitative values of some relevant parameters and properties that characterize the system should be known preferably by way of measurements. It is the primary objective of this laboratory course to give the student an understanding of the available measurement techniques; an opportunity to gain hands-on experience in carrying out the experiments as well as operating the apparatus and some practice in the art of technical report writing. The Production Engineering Laboratory has been designed to expose the student to the principles and procedures of production engineering for oil and gas analysis (physicochemical characterization and quality control) and the transport of fluids in pipes and conduits. The main objective is to familiarize students with the basic measurements that must be taken in production monitoring and control, as well as basic production engineering principles. It is also aimed to enhance the error analysis, critical evaluation and technical report writing skills of the student. Major pieces of equipment in this laboratory include: viscosimeters, oxygen bomb calorimeters, gas chromatograph, densitometers, centrifuges, dead weight testers, dew point testers, and a meter run setup. Laboratory experiences include, but are not limited to, the determination of density of clear organic substances and petroleum distillates that can be handled as liquids at test temperatures between 10 and 40 °C using digital density meters, the determination of the API gravity (or specific gravity) of crude oil, petroleum products normally handled as liquids (e.g. stabilized crude oil, stabilized gasoline, naphtha, kerosene, gas oils, lubricating oils, and non-waxy fuel oils) and alcohols using hydrometer and pycnometer methods, the calibration of Bourdon type pressure gauges by means of a dead weight testers and constructing of calibration charts for gauges that are not adjustable, the determination of water and sediment in crude oils by means of the centrifuge procedure, the determination of the heat of combustion of organic substances ranging in volatility including oil samples with volatiles ranging from that of distillates to that of residuals, the measurement of viscosity of crude oil and liquid petroleum products by means of measuring the time for a volume of liquid to flow under gravity through a calibrated glass capillary viscosimeter, the determination of water vapor content of gases by measurement of the dew point temperature and the calculation there from of the water vapor content, and the determination of a gas flow rates in pipelines by means of orifice plates and axial full-flow turbine meters.

**P N G 489 Engineering Evaluation of Oil and Gas Properties (3)**

The objective of this course is to introduce to students the application of present worth and rate-of-return analysis to problems peculiar to oil and gas evaluation. The course is divided into four sections: introduction to present worth and rate-of-return analysis; the calculation of oil and gas reserves; the analysis of decline curves; and the application of uncertainty and risk analysis to engineering project design and evaluation. This course is the first course of a four-course sequence (P N G 489, 490, 491, 492) that culminates in a capstone engineering design project and is intended to be taken during the first semester of the junior year. As such the application of these principles elucidated above to engineering design will be emphasized.

This course is a pre-requisite for most of the Petroleum and Natural Gas Engineering Major Courses. It is an elective course for majors such as Environmental Systems Engineering. It will be offered every Fall semester.

General Education: None

P N G 490 Introduction to Petroleum Engineering Design (1) Introduction to the concepts of engineering design as applied to petroleum and natural gas projects.

The objective of this course is to introduce to the students the principles of engineering design as applied to petroleum and natural gas projects. The course focuses on the analysis of physical data with respect to error and use of this data in design. Other topics to be visited include a definition of what is a project deliverable and establishment of timelines for their implementation. The salient points of the course are as follows: (1) This course is the first capstone engineering design course in the sequence of three courses. In this portion of the course students’ principal goal is to characterize the reservoir. In this process necessary basic sciences and engineering skills are utilized. (2) In reservoir characterization, students typically collect and analyze the data available in the literature and other related data provided by the operators. (3) In making a preliminary assessment towards field development students consider factors involving economic, environmental, social, ethical, health and safety considerations. (4) In this course, students work in teams. In each team, team members assume responsibilities as petrophysicist, drilling engineer, geologist, geophysicist production engineer, reservoir engineer and implement the necessary technical skill to fulfill their obligations. (5) This project starts from the ground level and ends with a complete field development plan. Within the context of the project (reservoir characterization) students have the opportunity to use the necessary skills to identify and formulate and solve the engineering problems and challenges that are faced. (6) In selecting the lease area the potential impact of project on the social and physical environments is considered and all the ethical responsibilities are studied in depth. (7) During every phase of the project the impact of decisions are considered within the framework of global, economic, environmental and societal context. (8) In this course the main contemporary issue the need for unconventional energy resources is the driving force behind the project. (9) In every phase of the project students are exposed to contemporary methodologies and engineering tools including forecasting, scenario planning and reservoir simulation. Also, whenever applicable the necessary engineering software is also incorporated in the development of the project.

P N G 491 Reservoir Engineering Design (1) Application of the concepts of reservoir and drilling engineering to petroleum engineering design projects.

Engineering design by definition is the integration of knowledge and skills acquired through experience, reading and formal instruction into a final product, the design. To that end, this course is the second course of a 3-course, 3-semester, sequence that will result in a comprehensive capstone-engineering project. As such, P N G 491 will utilize the knowledge gained from P N G 405, 410, 450 and 489 to the project design initiated in P N G 490. Course materials will include introduction to the simulator, development of the computer model, and the use of history match in design. The class will be divided into teams and students will be evaluated on the basis of their contribution to the team effort. All reports and presentations will be presented to the class as a product of the team.

P N G 492 Petroleum Engineering Capstone Design (1) Integration of petroleum and natural gas engineering concepts to project design.

Engineering design by definition is the integration of knowledge and skills acquired through experience, reading and formal instruction into a final product, the design. To that end, this course is the third course of a 3-course, 3-semester, sequence that will result in a comprehensive capstone-engineering project. As such, P N G 492 will utilize the knowledge gained from three semesters of formal instruction to the project design initiated in P N G 490 and continued on in P N G 491. Course material will include the application of spreadsheet programming to petroleum and natural gas project design and its use in project economic analysis and risk analysis.
The class will be divided into teams and students will be evaluated on the basis of their contribution to the team effort. All reports and presentations will be presented to the class as a product of the team.

Diversity: None
Bachelor of Arts: None
Effective: Spring 2014

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

P N G 530 Natural Gas Engineering (1-3) Flow in producing or storage reservoirs; gas well testing; transmission systems; storage cycle; current developments.

Natural Gas Engineering (1-3)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1999
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

P N G 550 Reactive Transport in the Subsurface (3) This course teaches principles of flow, transport, and reaction processes in the natural subsurface.

P N G 550 Reactive Transport in the Subsurface (3)
This course targets graduate students from various disciplines that work with chemical and physical processes in natural subsurface. This includes, for example, petroleum and natural gas engineering, geosciences, environmental engineering, agricultural engineering, civil engineering, chemical engineering, and applied mathematics. The course teaches fundamental concepts that are important in understanding subsurface reactive transport processes, as well as their quantitative representation and application. Covered topics include, for example, (bio)geochemical thermodynamics and kinetics, contaminant transport, and reactive transport coupling. Depending on the students’ interests, the course will discuss the applications of the principles in understanding and quantifying chemical weathering processes, environmental (bio)remediation, geological carbon sequestration, and reservoir souring.

The learning outcomes for the students are to 1) understand the mathematical representation of various types of (bio)geochemical reactions; 2) understand general principles governing the coupling among reactions, flow, and transport processes; 3) understand the importance of different processes under different conditions; 4) develop computational skills to simulate coupled flow, transport, and reactions using a reactive transport modeling code (for example, CrunchFlow); 5) develop the ability to communicate and collaborate within interdisciplinary teams.
The course will be taught through a combination of lectures that discuss general principles and reactive transport equations, and exercises with a series of example files. The students will learn to set up models, as well as to visualize and interpret the modeling output. The example files will be tailored to the students' interests every year.

P N G 590 (EME 590, F SC 590, MNG 590) Colloquium (1-3) Continuing seminars which consist of individual lectures by faculty, students or outside speakers on energy and mineral engineering issues.

P N G (EME/F SC/MNG) 590 Colloquium (1-3)
The objective of the course is to expose students through a seminar format to a wide range of topics on energy and mineral engineering. The lectures would be presented by faculty, students and guest speakers. Students would be required to write a short summary of each presentation and provide a critique of the presentation. Seminar topics will cover aspects of energy production, processing, utilization, and conservation, and the associated environmental, health and safety, and policy, economics, and management issues. Students are expected to keep up with current developments on each topic and to actively participate in the discussions. Students will be evaluated based on their class participation, and written summary and critique of each presentation. This is a required course in the energy and mineral engineering graduate program.

PHARM 553 Gastrointestinal and Immunomodulatory Therapeutics (1) This course focuses on pharmacology of drugs affecting gastrointestinal disorders, drugs used in therapy of inflammatory diseases, and immunomodulatory drugs for organ transplantation therapy.

PHARM 553 Gastrointestinal and Immunomodulatory Therapeutics (1)
This course covers the use of pharmacotherapies to treat gastrointestinal disorders, inflammation, and immune response. The emphasis is to examine the mechanisms underlying the effects of these drugs at various levels of biological organization (e.g., cell, tissue, and the whole body).

General Education: None
PHARM 554 Anticancer Therapeutics (1) This course provides an understanding of general principles of the induction, prevention and treatment of cancer.

This course introduces students to the concept of the multi-step process involved in carcinogenesis. Discussion of both synthetic drugs and naturally occurring compounds used in cancer prevention and cancer treatment is included. Potential future targets for cancer therapy are presented.

PHARM 561 Neuropharmacology (2) This course introduces basic principles of human neuropharmacology, with primary emphasis on drugs active in the central nervous system.

This course covers the use of pharmacotherapies to treat a variety of neuropsychiatric disorders and other disorders of central nervous system function. Discussion includes: 1) normal neurophysiology; 2) the neuropathology of common disorders; 3) mechanisms of action of drugs affecting the central nervous system and of drugs used to treat disorders of this system; 4) the experimental bases for our knowledge of the actions of these drugs; 5) animal models useful for drug discovery; and 6) the mechanisms underlying drugs of abuse.

PHARM 562 Endocrine Pharmacology (2) This course presents basic principles of human endocrine pharmacology, emphasizing drugs active in the endocrine and reproductive systems.

This course covers pharmacotherapies used to treat disorders of the endocrine and neuroendocrine systems and to modulate reproduction. Discussion includes: 1) the physiological basis for normal endocrine homeostasis; 2) the pathology of common disorders; 3) the mechanisms of action of drugs affecting these systems and of drugs used to treat disorders of these systems; 4) the experimental bases for these drugs and therapies; and 5) animal models useful for endocrine drug discovery.

PHARM 581 (PSIO 581) Maintaining Homeostasis A: Heart and Vasculature (1) Physiology of the cardiovascular system.

This course will cover general principles related to cellular and systemic physiology and pharmacology related to the autonomic nervous system and the cardiovascular system. Materials will be presented through reading and study of textbook materials and the primary scientific literature, reinforced and assisted by lectures and discussions. Concepts of this course are generally organized by organ system designed to address important homeostatic control mechanisms, both neural and humoral, related to the cardiovascular system. Topics to be covered include the physiology of the autonomic nervous system; pharmacology (mechanisms and sites of action; receptors and associated cellular transduction mechanisms).
cascades; toxicity; contraindications) of drugs that affect the autonomic nervous system including cholinceptor-activating and cholinesterase-inhibiting drugs, cholinceptor-blocking drugs, adrenoceptor agonists and antagonists; synaptic transmission; mechanical properties of skeletal, cardiac and smooth muscle; and the regulation of cardiac function and microcirculation.

PHARM 583 (PSIO 583) Maintaining Homeostasis C: Kidney (1) Renal physiology and pharmacology.

PHARM (PSIO) 583 Maintaining Homeostasis C: Kidney (1)

This course will cover general principles related to cellular and systemic physiology and pharmacology (mechanisms and sites of action; receptors and associated cellular transduction cascades; toxicity; contraindications) of drugs that affect the pulmonary and renal systems. Materials will be presented through reading and study of textbook materials and the primary scientific literature, reinforced and assisted by lectures and discussions. Concepts of this course are generally organized by organ system designed to address important homeostatic control mechanisms related to the lung and kidney. Topics to be covered include the physiology and pharmacology of the pulmonary and renal system: mechanics of breathing, alveolar ventilation, blood flow to the lung, ventilation-perfusion relationships, diffusion and transport of gases, control of breathing, glomerular filtration and renal blood flow, renal transport mechanisms involved in reabsorption and secretion, regulation of effective circulating volume and salt balance, regulation of potassium balance, regulation of acid-base balance during health and disease, principles of pharmacology related to pulmonary and renal systems; principles of gastrointestinal physiology related to drug disposal and action. The course objectives are to assist students in understanding and mastering the basic concepts related to the functions of the lung and kidney, to assure that students obtain a thorough comprehension of basic pharmacological principles, and then to have students apply this knowledge to problems and case studies relevant to pathophysiology and drug action.

PHARM 584 (ANAT 584) Human Anatomy and Development A: Gross Human Anatomy (1) Explore gross human anatomy providing orientation to organs and the overall relationship of organs and structures within the human body.

PHARM (ANAT) 584 Human Anatomy and Development A: Gross Human Anatomy (1)

This course will provide a concise but thorough description of the gross human anatomy. With the use of pre-dissected prosection or model representations of the human body, anatomic position, orientation (e.g., retroperitoneal, superficial, deep, ipsilateral), and identification of structures within major body cavities (thorax, abdomen) of the human body will be conducted. Evaluation of the musculoskeletal system will include structure of bones, classification of bones in the axial and appendicular skeleton, discussion of joints, skeletal muscles, and accessory structures related to muscle action including fascia. Evaluation of digestion system will include components involved with alimentary canal as well as accessory organs. Evaluation of the cardiovascular system will focus on the communication network, heart anatomy and blood flow through its chambers, pulmonary and systemic circulation, as well as relationship of arteries, veins, capillaries to the heart. Evaluation of the nervous system will identify and discuss major structures of the central nervous system including the brain and spinal cord, peripheral nervous system, and enteric nervous system. For each system, the focus will be knowledge necessary for understanding, utilizing, and appreciating the role of the human body in biomedical and translational research.

**PHARM 586 (ANAT 586) Human Anatomy and Development C: Stem Cell Biology and Regenerative Medicine (1)**
Exploration of stem cell biology and the role of stem cells in regenerative medicine.

**PHARM (ANAT) 586 Human Anatomy and Development C: Stem Cell Biology and Regenerative Medicine (1)**
This course will provide an evaluation of stem cell biology and regenerative medicine. In particular, discussions will focus on the five sources of embryonic stem cells (adult stem cells, amniotic fluid-derived stem cells, embryonic stem cells derived using *in vitro* fertilization technologies, somatic cell nuclear transfer cloning-derived stem cells, and stem cells derived by parthenogenetically-activating oocytes). In addition to providing detailed information on the biology underlying stem cells, group discussions will focus on ethical advantages and disadvantages for each of the five distinct types of stem cells. Work will then turn to current understanding of changes in transcriptome and proteome control of differentiation. As well, discussions will focus on attempts to use stem cells in regenerative medicine. This course will be designed as a mixture of didactic lectures with a particular focus on the current literature. This latter aspect of the course is essential in that much of our current understanding of stem cells has not yet made it into any common text books.

PHIL 460 (US;IL) (AF AM 460) African American Philosophy (3) Major works by African American Philosophers, on topics of race, freedom, citizenship, nationhood, law and society.

African American philosophers and social activists have produced important texts that both take their place in the philosophical canon and revise the canon and indeed how we understand the practice of philosophy. This course surveys twentieth century African American philosophy, from Du Bois's Souls of Black Folk and Dusk of Dawn, to King's Why We Can't Wait, to Davis's Women, Race and Class, to Boxill's Blacks and Social Justice. The books refer back to both liberal democratic and socialist philosophical treatises, as well as theological and jurisprudential writings, in order to construct
new conceptions of race, citizenship, freedom, the rule of law. Moreover, they are all grounded in the concrete, problematic situation of African Americans in twentieth century America, so that they raise with special urgency the question of how philosophical reflection can address social change. In classroom debate, students will rediscover and critically examine how the history of racial strife and reconciliation affects local, national and international civic life. One constant feature of this course is that white students and students of color become aware of differing perspectives that are hard to reconcile; this helps them to re-examine their own social identities and those of their classmates. When the course is team-taught (with one white faculty member and one faculty member of color) the same dynamic occurs between the instructor: watching them reconcile their views in discussion and pedagogy helps the students as well. It is hoped that this course will often or always be team-taught.

**Epistemology Seminar (3 per semester/maximum of 6)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2000

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PHIL 538** (WMNST 538) Feminist Philosophy Seminar (3) Critically examines feminist approaches to ethics, epistemology, philosophy of science, metaphysics, social/political philosophy, and the history of philosophy.

**PHIL (WMNST) 538 Feminist Philosophy Seminar (3)**

This course aims to give students an understanding of the philosophical concepts and problems of feminist philosophy. The course will focus on major topics, such as the history of philosophy, ethics, social/political philosophy, epistemology and philosophy of science, and metaphysics, and figures within 20th century feminist philosophy with the concurrent goal of bringing them to bear on contemporary issues involving gender's relationship to race, sexuality, class, disability, nationality and age. This course builds upon PHIL 438 Feminist Philosophy and counts towards the requirements of the dual title degree in Philosophy and Women's Studies. Evaluation methods include preparation for and participation in class meetings, two short discussion papers, and a final term paper. The course will be offered at least once every four semesters with an enrollment goal of 20. Specific course content will vary with instructor.

Bachelor of Arts: None
Effective: Summer 2005

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PHIL 539** Critical Philosophy of Race (3 per semester/maximum of 6) The study of philosophical issues raised by racism and by the concept of race and other related concepts.

**PHIL 539 Critical Philosophy of Race (3 per semester/maximum of 6)**

This course provides an intensive examination of a major area of philosophical research: the philosophical examination of racism and of our thinking about race. It will investigate philosophical debates about such topics as mixed-race identity, going beyond the Black-White binary, the distinction between racism and xenophobia, the distinction between race and ethnicity, the debate about the reality of race, as well as questions about the nature and genealogy of racism. The course will have a historical component that will show how thinking in terms of the concept of race first developed and was transformed across time as well as addressing contemporary issues that includes an examination both of the dominant theories and definitions or racial identity and of ethical and political questions raised by the persistence of the notion of race. The course will also examine debates about the complicity of certain canonical figures in the history of philosophy, such as Immanuel Kant and Georg Wilhelm Friedrich Hegel in the conceptualization of race and the spread of philosophical racism. In addition to these two philosophers the following authors will be among those studied: Johann Friedrich Blumenbach, Frederick Douglass, Antenor Firmin, W. E. B. Du Bois, Anna Julia Cooper, Alain Locke, Paulette Nardal, Jean-Paul Sartre, Frantz Fanon, Anthony Kwame Appiah, Gloria Anzaldua, Bernard Boxill, and Angela Davis. Race will be examined in its relation to other ways of thinking about human difference, including class, gender, nationality, religion, and sexuality. Attention will be given to diverse experiences in the US context, such as those of African Americans, Latina/os, Asian Americans, Native Americans, Irish Americans, and so on. In addition to examining the role race has played and continues to play in the United States of America, the ways in which race is approached in other parts of the world, for example in China, will also be the subject of investigation. The course content will vary, dependent upon the instructor.
PHIL 553  Ancient Philosophy Seminar (3 per semester/maximum of 6)  Analyzes specific concerns and texts of ancient philosophy including those of Plato and Aristotle; course content varies with instructor.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHIL 554  Medieval Philosophy Seminar (3 per semester/maximum of 6)  Critical examination of medieval texts and philosophers, including Augustine, Anselm, Aquinas, Duns Scotus, and Ockham; course content varies with instructor.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHIL 555  Modern Philosophy Seminar (3 per semester/maximum of 6)  Examines rationalism, empiricism, and other philosophical movements from Bacon and Descartes to Kant and Mill; course content varies with instructor.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHIL 556  19th-Century Philosophy Seminar (3 per semester, maximum of 6)  Examination of philosophy from Hegel to Nietzsche on history, dialectic, ideology, existence, science, and art; course content varies with instructor.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHIL 557  20th Century Philosophy Seminar (3 per semester/maximum of 6)  Central problems in works of twentieth-century philosophers including Russell, Dewey, Wittgenstein, Heidegger, Foucault, Levinas; course content varies with instructor.

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
PHIL 558 Contemporary Philosophy Seminar (3 per semester, maximum of 6) Critically investigates diverse recent figures and problems of continental, pragmatic, and analytic philosophy; course content varies with instructor.

PHIL 563 Major Figures in Nineteenth-Century Philosophy (3 per semester/maximum of 12) Close study of a major figure in nineteenth-century philosophy through one central text or several important texts.

PHIL 563 Major Figures in Nineteenth-Century Philosophy (3 per semester/maximum of 12)

This course provides an intensive examination of one major figure in nineteenth-century philosophy, such as Friedrich Wilhelm Schelling, Georg Friedrich Hegel, Arthur Schopenhauer, Auguste Comte, William James, Karl Marx, Charles Sanders Peirce, and Friedrich Nietzsche. Regardless of the figure selected, the course focuses on one major text written by that figure (such as in the case of Hegel the Phenomenology of Spirit or in the case of Schopenhauer The World as Will and Representation) or on two complementary texts by a major figure (for example, Schelling’s First Outline of a System of the Philosophy of Nature and his The Ideas for a Philosophy of Nature or Nietzsche’s Beyond Good and Evil and The Genealogy of Morals). Possible topics covered in relation to the figure selected would include as appropriate to the figure: knowledge; reason; language; subjectivity; logic; nature and spirit; dialectics; ideology; philosophy of history; religion; truth; ethics; aesthetics; and genealogy. The students will also be introduced to the major secondary works written about this author and the controversies they have generated. The course content will vary, dependent upon the instructor.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2012

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHIL 564 Major Figures in Twentieth-Century Philosophy (3 per semester/maximum of 12) Close study of a major figure in twentieth-century philosophy by means of one central text or several important texts.

PHIL 564 Major Figures in Twentieth-Century Philosophy (3 per semester/maximum of 12)

The course aims to provide students with a “building block” in their knowledge of the history of philosophy. That is, the students will achieve an expert’s understanding of the central ideas of one figure in twentieth-century philosophy. On this basis, students will be able to develop a comprehensive understanding of the figure’s entire corpus and complete range of ideas. Moreover, students will be able to develop a comprehensive understanding of the historical period. There are many possible figures for this course: Edmund Husserl, Martin Heidegger, Emmanuel Levinas, Hans-Georg Gadamer, Jean-Paul Sartre, Maurice Merleau-Ponty, Simone de Beauvoir, Jacques Derrida, Gilles Deleuze, Michel Foucault, Julia Kristeva, Alain Badiou, John Dewey, Jurgen Habermas, Rudolf Carnap, Wilfred Sellars, W. V. O. Quine, Hilary Putnam, and
Richard Rorty. In relation to Husserl, for example, students will master the problems (relativism and skepticism) to which phenomenology is responding; the phenomenological method (the epoché, the reductions, eidetic variation); and how the transcendental position of phenomenology at once responds to the question of knowledge and to the question of being. This knowledge will allow students to develop an understanding of the phenomenology’s crucial role in the development of twentieth-century philosophy, influencing not only existentialism, structuralism, and post-structuralism, but also analytic philosophy. In relation to Merleau-Ponty, for example, students will learn how embodied perception attempts to respond to the traditional problem of mind-body dualism. This knowledge will allow students to develop an understanding not only of Merleau-Ponty’s view of language but also his view of politics. From this developed understanding of Merleau-Ponty, students will be able to understand how Merleau-Ponty differs from Bergson, Merleau-Ponty’s predecessor, from Sartre, Merleau-Ponty’s contemporary, and from Foucault, Merleau-Ponty’s inheritor. The course content will vary, dependent upon the instructor.

PHIL 571 (BIOET 501) Perspectives and Methods in Bioethics (3) This course explores a variety of theories and methods in bioethics and applies them to a selection of current topics.

PHIL 571 (BIOET 501) Perspectives and Methods in Bioethics (3)
This course explores the broad range of disciplinary, theoretical and methodological approaches employed in bioethics today through their application to a variety of contemporary issues. The course also examines the intellectual, cultural and disciplinary history of bioethics, the frontiers of the field (e.g. genetics and ethics, neuroethics and transhumanism) as well as current debates about its politics, ethics and future. This course complements BIOET 502 PERSPECTIVES IN MACRO-BIOETHICS, and is a core requirement for the dual-title Ph.D. in bioethics.

PHIL 572 (BIOET 502) Perspectives in Macro-Bioethics (3) This course explores systemic and structural issues in bioethics, and the theories and methodological tools necessary to address them.

PHIL 572 (BIOET 502) Perspectives in Macro-Bioethics (3)
This course aims to provide students with an understanding of macro-ethical issues in bioethics, and the theoretical and methodological tools necessary to address them. The course broadens the traditional discussion of the ethical obligations of individuals considered in isolation (micro-ethics) to include the ethical obligations of individuals as members of institutions, communities and other collectives, and the collective ethical obligations of these larger entities (macro-ethics). The course explores macro-ethical perspectives related to biomedical research and delivery of health care, as well as the ethical implications of potential threats to public health, the broad social determinants of health, and the systemic and structural challenges to health and health care from global perspectives. Topics may include the ethical challenges presented by industry-sponsored research, biomedical research on vulnerable populations and in the developing world, access to health care and health care reform, public health emergencies, and the relationship between environment and health, and food and health.

PHIL 573 (BIOET 573) Ethics and the Responsible Conduct of Biomedical Research (3) Provides an understanding of ethical issues arising in the responsible conduct of biomedical research and frameworks for critically analyzing them.

PHIL 573 (BIOET 503) Ethics and the Responsible Conduct of Biomedical Research (3)
This course is designed to instill an awareness of ethical issues inherent in the conduct of biomedical research. The course will discuss the research process including conception and design, data collection, analysis, and reporting from the perspective of ensuring research integrity. The goal is to enable students to identify ethical issues (ethical awareness/sensitivity) and to develop moral reasoning skills to reach ethically justifiable decisions. The course will be both retrospective and prospective: it will draw on historical examples of egregious or questionable practices in the
conduct of biomedical research to better understand the evolution of research ethics in the 20th century, and it will explore the challenges for research ethics in the 21st century.

PHIL 803 (HLS 803) Homeland Security: Social and Ethical Issues (3) This course will examine the social, political, legal, and ethical issues that arise in the context of homeland security.

PHIL (HLS) 803 Homeland Security: Social and Ethical Issues (3)

PHIL (HLS) 803 provides a foundation for applying philosophical and ethical understanding to homeland security professions by drawing on both theoretical and practical approaches. It includes an overview of philosophical theories of ethics, political philosophy, and legal theory relevant to security practices and policies, as well as opportunity to develop critical thinking and communication skills in their application to particular cases related to homeland security through analysis and discussion. Historical and contemporary material will be examined to investigate issues such as the right to privacy, the nature and value of freedom, the justification of state security, and legal rights and responsibilities. Because the course is designed as a core offering in the Intercollege Masters of Homeland Security (IMP HLS), it must provide a basis for critical analysis of ethical issues faced by professionals in the homeland security arena.

Phys Med&Rehabilitat (PMR)

PMR 730 Physical Medicine and Rehabilitation Elective (3rd and 4th year) (5) This elective is for 3rd and 4th year medical students interested in gaining experience in the field of Adult and Pediatric Physical Medicine and Rehabilitation, improving diagnostic skills related to the complications of disability, and improving neurologic and musculoskeletal examination skills.

Physical Medicine and Rehabilitation Elective (3rd and 4th year) (5)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2011
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Physician Asst Stdis (PAS)

PAS 701 Applied Human Structure and Function I (2) Course will discuss the clinically relevant anatomy and structural information necessary for clinical practice emphasizing surface anatomy and surface markings.

Applied Human Structure and Function I (2)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 704 PAS 707 PAS 710 PAS 713 PAS 716 PAS 720

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 704 Clinical Medicine I (5) This is the cornerstone of all the medically relevant courses. Various disease processes will be described, along with the incidence, prevalence, pathophysiology, treatment plans, and expected outcomes.

The Pennsylvania State University
Clinical Medicine I (5)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 701 PAS 707 PAS 710 PAS 713 PAS 716 PAS 720

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 707 Pathophysiology I (2) This class provides a systems approach to basic concepts of disease processes which enables analysis for alterations to body systems.

Pathophysiology I (2)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 701 PAS 704 PAS 702 PAS 710 PAS 721 PAS 714

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 710 Pharmacology I (2) This class will review the basic principles of drug action, their indications, contraindications, toxicities, and potential side effects.

Pharmacology I (2)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 701 PAS 704 PAS 707 PAS 713 PAS 716 PAS 720

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 713 Pharmacotherapeutics I (1) This course discusses the mechanism of action, medication classification, the indications, contraindications, and adverse events seen with medication use.

Pharmacotherapeutics I (1)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 701 PAS 704 PAS 707 PAS 710 PAS 716 PAS 720

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 716 History and Physical Examination I (2) Techniques for eliciting a complete medical history, performance of a complete physical examination, and accurate recording in a patient record.

History and Physical Examination I (2)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite:
Concurrent: PAS 701 PAS 704 PAS 707 PAS 710 PAS 713

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 720 Pediatric Studies (1) This course will prepare students for their role in the evaluation and management of the pediatric population.

Pediatric Studies (1)
General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2014
Prerequisite: PAS 701 PAS 704 PAS 707 PAS 710 PAS 713 PAS 716

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PAS 721 US Health Care System/Legal Medicine (1) This course is intended to introduce the graduate physician assistant to the health care delivery system in the United States with reference to how the physician assistant profession fits into this system for providing accessible, comprehensive, and cost-effective care. This course will also cover the legal aspect involved with medical practice.

US Health Care System/Legal Medicine (1)

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

Physics (PHYS)

PHYS 400 Intermediate Electricity and Magnetism (3-4) Electrostatics and magnetostatics in vacuum; electrical and magnetic properties of matter; electrodynamics, Maxwell's equations, conservation laws, electromagnetic waves and radiation.

PHYS 400 Intermediate Electricity and Magnetism I (3-4)

A second undergraduate course in electricity and magnetism, required of all physics majors who typically take it in their fifth or sixth semester. The course includes a review of vector calculus, and in-depth discussions of electrostatics, magnetostatics, in vacuum and in matter, time-varying electric and magnetic fields and electrodynamics, leading to Maxwell's equations. Discussions of conservation laws for charge, energy, and momentum, electromagnetic waves (in vacuum and in matter and at boundaries), electromagnetic vector and scalar potentials and fields, and an introduction to radiation are included.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Fall 2014 Future: Fall 2014
Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PHYS 400 Intermediate Electricity and Magnetism (3-4) Electrostatics and magnetostatics in vacuum; electrical and magnetic properties of matter; electrodynamics, Maxwell's equations, conservation laws, electromagnetic waves and radiation.

Bachelor of Arts: None
Effective: Spring 2007
Prerequisite:

**PHYS 406 Subatomic Physics (3)**
Introductory treatment of elementary particles, fundamental strong and electroweak interactions, nuclear structure, accelerators, particle detection, nuclear astrophysics.

Subatomic Physics (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1995
Prerequisite:

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PHYS 410 Introduction to Quantum Mechanics I (3-4)**
Basic postulates; Schrodinger wave equation; stationary states; variational method; scattering in one dimension; orbital angular momentum; hydrogen atom; numerical methods.

Introduction to Quantum Mechanics I (3-4)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 2007
Prerequisite:

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PHYS 411 Introduction to Quantum Mechanics II (3)**
General theory of angular momentum; approximation methods; scattering theory; radiation theory; applications to atomic, molecular, condensed matter, nuclear and particle physics.

Introduction to Quantum Mechanics II (3)

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Spring 1994
Prerequisite:

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PHYS 412 Solid State Physics I (3)**
Crystal symmetry, x-ray structure analysis, lattice vibrations, thermal properties, free electron transport theory, elementary one-electron quantum theory of solids.

Solid State Physics I (3)
PHYS 413 Solid State Physics II (3) Quantum theory of electronic and optical properties of solids, semiconductors, dielectrics, magnetic properties, crystal imperfections, low-temperature effects, and superconductivity.

Solid State Physics II (3)

PHYS 414 Solid State Physics (3) Crystal structure; reciprocal lattice; X-ray diffraction; lattice vibrations; thermal properties; free electron gas model; energy bands; semiconductors; magnetism.

Solid State Physics (3)

PHYS 419 (MATH 419) Theoretical Mechanics (3) Principles of Newtonian, Lagrangian, and Hamiltonian mechanics of particles with applications to vibrations, rotations, orbital motion, and collisions.

PHYS (MATH) 419 Theoretical Mechanics (3)

A second course in classical mechanics, required of all physics majors who typically take it in their 5th or 6th semester. The course includes a review of relevant mathematics, detailed discussions of advanced topics in Newtonian mechanics, introductions to Lagrangian and Hamiltonian dynamics, and applications to such forced oscillations, orbital motion, vibrational motion and normal modes, rigid body motion, and collisions.

It is a prerequisite for Physics 461, which is a second semester extension. It is also a valuable background for most 400-level physics courses, especially Physics 410.

PHYS 420 Thermal Physics (3) Basic postulates of statistical mechanics and thermodynamics, microscopic quantum states and macroscopic parameters; partition functions; Maxwell- Boltzmann and quantum statistics.

Thermal Physics (3)

PHYS 421W Research Methods in Physics (3) Methodology focusing on the theory of measurement and experiment design.

Research Methods in Physics (3)
PHYS 443 Intermediate Acoustics (3) Vibration and simple vibrating systems, sound wave propagation, acoustic instruments, recent developments.

An intermediate acoustics course, used as an elective by Physics majors in many options and used as a requirement by Physics majors in the Acoustics option. Building on classical wave theory learned in the 200-level introductory sequence, this course discusses such topics as the mathematical foundations of wave equations, basic acoustic systems, acoustics in fluids, attenuation and the fluctuation-dissipation theorem, and acoustical radiation and scattering. The emphasis is on the basics of mathematical and physical acoustics rather than applied acoustics.

PHYS 444 Topics in Contemporary Physics (2) Modern research topics and career opportunities in physics; employment, graduate education, and tailoring the physics curriculum to meet career goals.

A course required of all Physics majors, designed to be taken in the Spring semester of the junior year. Introduces students to modern research areas in physics at Penn State and elsewhere. Provides background on career choices available with an undergraduate physics degree, including employment opportunities, planning for graduate study, and tailoring the physics curriculum to meet career goals. The course structure is typically comprised of talks by Penn State faculty, outside visitors, students panels, and other information speakers, with students writing short and long reports using the class presentations discussions, and research from outside sources (research journals, internet, etc.) as background material.

PHYS 446 The Year in Physics: A Seminar on the Latest Research (1) Discussion recent research in physics.

PHYS 457 Experimental Physics (1-3) Selected experiments in various fields of physics.

An intermediate laboratory course, required of all Physics majors and taken by other students, typically in their junior/senior years, this course provides an introduction to modern laboratory techniques and instrumentation used in research labs. Typical 'short' experiments include X-ray diffraction, Compton scattering, velocity of light determination, high-temperature superconductors, Raman scattering, Hall effect, scanning tunneling microscopy (STM), and many others, as well as long experiments. This three-credit course also serves as the writing intensive course at the 400-level for most physics majors. One- and two-credit versions of 457 (without the writing-intensive component) are taken by science and education students outside of physics.
PHYS 457W Experimental Physics (3) Selected experiments in various fields in physics.

PHYS 458 Intermediate Optics (4) Geometrical and physical optics: theory of lens systems, aberrations, apertures, interference, diffraction, polarization.

An intermediate optics course which builds on the wave and optics used in the 200-level introductory course, this course (which includes a lab component) focuses on physical and geometrical optics, propagation of light and its interaction with matter, polarization, interference, and diffraction. Optical components such as lenses, mirrors, prisms, fiber optics, spectrometers, and interferometers are discussed and employed. The laboratory component includes a number of 1-2 period experiments designed to illustrate the principles of applied geometrical and physical optics. Longer (5 period) experiments are also included which utilize modern, computer-controlled multi-channel detection systems and are applied to such systems as thin-film optics and the optics of semi-conductors.

PHYS 462 Applications of Physics in Medicine (3) Applications of physics in human physiology and in instrumentation for medical diagnosis and treatment.

Applications of Physics in Medicine (3)

This course is a general survey of applications of physics in understanding the physiology of the human body--for example, the function of the eye, ear, and electrical conduction. Physical principles behind diagnostic medical measurement are covered, including imaging modalities: X-ray, nuclear, magnetic resonance, and ultrasound. Treatment applications such as laser surgery and radiation therapy are also covered. The course is appropriate for students intending work in a health profession.

Prerequisite:

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.
PHYS 472 Elements of Nuclear Physics and its Applications to Medical Imaging and Treatments (3)

Modern physics tools are used now in numerous medical diagnostic methods, for various treatments of tumors, and so on. The class will focus several aspects of modern physics relevant to medical applications: (i) mechanisms of interaction of high energy particles, i.e. photons, electrons, protons, neutrons, and nuclei, with materials and methods of generating beams of such particles, (ii) applications of such beams for obtaining images of the body, (iii) radioactive decays of nuclei and use of the nuclear decays for imaging of dynamical processes in the body, (iv) shell structure of nuclei and applications of nuclear magnetic resonance in imaging. The course will allow students to understand the physics underlying the medical application of modern physics and physics of a wide range of new tools used in medicine, including computer tomography, positron emission tomography, and magnetic resonance imaging, as well as use of photon, proton and nuclear beams for tumor treatments.

PHYS 479 (MATH 479) Special and General Relativity (3)

This course is intended as an elective course (within the undergraduate Physics program) for Physics majors to be taken in their senior year. Intended to be cross-listed with MATH, it can also be used in support of a Mathematics minor and, in some options, within the Math program as a program elective as well. The course significantly expands upon the introduction to Special Relativity (SR) seen in PHYS 237, including discussions of experimental tests of SR and applications to relativistic mechanics. It then introduces students to the mathematical machinery required to understand General Relativity (GR), starting with the description of curved spacetimes and geodesics. It discusses solutions to the Einstein equations and surveys the classic tests which established the validity of General Relativity. It concludes with applications of GR in such areas as black hole physics, the generation and detection of gravitational waves, other topics (such as cosmology, relativistic astrophysics, etc.).

**PHYS 518** Critical Phenomena and Field Theory (3) Critical phenomena using field theoretical and renormalization group techniques; solvable statistical models and conformal field study; fluctuations and random processes.

**Critical Phenomena and Field Theory (3)**

The application of field theoretical methods, in particular, the renormalization group approach, has profoundly influenced our understanding of the physics of continuous phase transitions. In particular, they reveal the origin of universality...
between seemingly unrelated phase transitions, and the reason for the failure of the Landau Ginzburg theory close to the critical point. This course will begin with the concepts of the order parameter and spontaneous symmetry breaking, and the shortcomings of the Landau Ginzburg theory that neglects fluctuations of the order parameter. Subsequently, we will introduce field theoretical techniques and Feynman diagrams, and the basic foundations of the renormalization group method for integrating out rapidly fluctuating modes of the order parameter. These concepts will be applied to various classes of phase transitions, including the Heisenberg ferromagnet, nonlinear sigma model, and the Kosterlitz-Thouless model. Epsilon expansion will be performed in detail starting from both four and two dimensions, and a connection will be made to experiments, such as superfluid transition in thin helium films. No prior knowledge of field theory is required. The course grade will be based upon homework assignments and a term paper.

**PHYS 545 (ASTRO 545) Cosmology (3)** Modern cosmology of the early universe, including inflation, the cosmic microwave background, nucleosynthesis, dark matter and energy.

**Phys (ASTRO) 545 Cosmology (3)**

Cosmology is the scientific study of the universe as a whole: its physical contents, principal physical processes, and evolution through time. Modern cosmology, which began in the early 20th century, is undergoing a renaissance as a precision science as powerful ground- and space-based telescopes allow us to observe the formation of the first stars, galaxies and galaxy clusters; the echoes of the inflationary epoch as they are impressed upon the cosmic microwave background; and evidence for and clues to the nature of the mysterious dark energy, which is driving the accelerating expansion of the universe. This course will introduce students to the key observations and the theoretical framework through which we understand the physical cosmology of the early universe.

PHYS 555 (MATSE 555) Polymer Physics I (3) Introduction to the fundamental concepts needed to understand the physics applicable to polymer melts, solutions and gels.

PHYS (MATSE) 555 Polymer Physics I (3)
This course develops fundamental understanding of the conformations of polymers in solution and melt states. We start with ideal chains that have random walk statistics. Next excluded volume is introduced to understand the self-avoiding walk conformation and collapsed conformation of real chains. The behavior ideal and real chains are studied in extension, compression and adsorption. While positive excluded volume leads to swelling, negative excluded volume leads to collapse and phase separation. The phase behavior of polymer mixtures and solutions is described in detail. Semidilute solutions are understood in terms of two length scales where each chain changes it’s conformational statistics. Scattering is used to determine the conformation of chains, their molar mass and their interactions with surroundings. Percollation theory is introduced to model the statistics of random branching and gelation. The rubber elasticity of fully developed networks is understood in terms of the stretching laws for network chains. Entanglement effects, swelling and viscoelasticity are discussed in detail. Once the conformations of polymers are understood, dynamics of polymer liquids are considered. In dilute solutions hydrodynamic interactions dominate and the viscoelasticity predicted by the Zimm model is derived. In unentangled melts of short chains, hydrodynamic interactions are screened and the Rouse model is used to understand viscoelasticity. Unentangled polymers in semidilute solutions have Zimm dynamics on small length scales and Rouse dynamics on longer length scales. Dynamic scattering techniques are discussed for measuring polymer dynamics. Entanglement effects are described using the tube model, where surrounding chains confine the motion of a given polymer to a tube-like region. The effects of concentration, chain length and polydispersity of linear chain polymer liquids are discussed in detail. The effects of branching on polymer dynamics are introduced at the level of simple structures such as star polymers and comb polymers.

The course assumes some prior knowledge of polymers, usually obtained through an introductory undergraduate course. The students should attain a working understanding of the basic concepts of polymer physics in this course, allowing them to tackle more difficult problems in their research. Such skills are reinforced through homework and take-home examinations.

PHYS 557 Electrodynamics (3) Special relativity, electromagnetic fields, Maxwell’s equations, conservation laws, electrostatics and magnetostatics.

PHYS 557 Electrodynamics (3)
The first half of the course starts from special relativity and uses Hamilton’s principle to derive relativistic dynamics and Maxwell’s equations. This approach, developed by Landau and Lifshitz, sets classical electrodynamics in a broad base of theoretical physics, and provides insights to solving many interesting problems that might be hard to solve starting from the traditional approach of deriving Maxwell’s equations empirically through Coulomb’s law, the law of Biot and Savart, Faraday’s law, and Maxwell’s inclusion of displacement current. The second half is based on the classic textbook by Jackson, and is devoted to application of electrodynamics in various settings. This includes dynamics of charged particles in given electromagnetic fields, with special emphasis on problems with symmetry and the guiding center dynamics. Examples of such topics include electromechanical problems with the use of Lagrangian; fields generated by given distributions of charges and currents, especially for case of small sources, and the use of multiple expansions; polarization and magnetization, and Maxwell’s equations in continuous media; boundary value problems; electromagnetic waves with single frequency in vacuum and medium; wave guides and resonant cavities; the generation of electromagnetic radiation.

PHYS 571 Modern Atomic Physics (3) Light-atom interactions, atomic structure, laser cooling and trapping, interferometry, and Bose-Einstein condensation.

PHYS 571 Modern Atomic Physics (3)

Students will learn the physics behind most of the major recent developments in the field of atomic physics, at the level
required for research at the graduate level. Material to be covered will include selected topics from the following list: Light-atom interactions, atomic structure, laser cooling, atom trapping and atomic optics, atom interferometry, precision measurements with atoms, quantum computing with atoms, atomic Bose-Einstein condensates, degenerate Fermi gases, reduced dimensionality systems, simulating condensed matter physics with atoms. Students will enhance their technical writing and presentation skills. Students will use the background they have acquired to develop an oral presentation related to a research advance related to modern atomic physics.

PHYS 580 Elements of Network Science and Its Applications (3) Introduction to elements of network theory used to describe and model complex networks; applications in social, biological, and technological networks.

PHYS 580 Elements of Network Science and Its Applications (3)

Network Science is the study of network representations of physical, biological, and social phenomena leading to predictive models of these phenomena. This class will focus on four main questions asked by network science: (i) How do we use data analysis methods to determine or infer the interaction graphs underlying complex systems? (ii) How can we characterize the organizational features of large-scale networks? (iii) What are the mechanisms that determine the common topological features of a wide variety of networks? (iv) To what extent does the organization of the interaction network underlying a complex system determine the dynamical behavior (e.g. steady state or oscillations) of the system? Applications in social, biological and technological networks will be examined. As Network Science is an interdisciplinary field of research, the course is open and should be of interest to a wide range of graduate students in degree programs in physics, social sciences, life sciences, mathematics, engineering, and computer science.

PSIO 503 Cellular Physiology (1) PSIO 503 is a physiology course that focuses on cellular aspects of physiology.

PSIO 503 Cellular Physiology (1)
The course in Cellular Physiology is a one semester, one credit course that will cover aspects of physiology that are cellular-based. Topics in organ physiology will be included in more comprehensive 3 credit course (PSIO 504). The course will meet for 1 hour sessions, three times per week for approximately one month. The course will be offered in the fall semester. It is designed for graduate students in other disciplines who are interested in integrating the cellular aspects of physiology into their graduate education. Although there are no prerequisites for the course, prior courses in physiology and/or biochemistry is beneficial.

The course will expand upon material in an assigned physiology textbook. Text chapters will be assigned as reading material prior to each meeting. The instructor will review the assigned material during the beginning of each meeting, after which more detailed aspects of the material will be discussed.

The course will have one final examination. The exam will be composed of a mixture of short essays, multiple choice and problem-solving questions. The lectures in PSIO 503 form the first block of the lectures in the more comprehensive PSIO 504 course. Students should enroll in either PSIO 503 or PSIO 504.

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2000

Note: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

PSIO 504 Cellular and Integrative Physiology (3) PSIO 504 is a physiology course that integrates cellular and organ-based physiology concepts.

PSIO 504 Cellular and Integrative Physiology (3)
The course in Cellular and Integrative Physiology is a one semester, three credit course that will cover all major aspects of physiology. A special emphasis will be placed on how cellular aspects of physiology are integrated with organ physiology. The course will meet for 1 hour sessions, three times per week. The course will be offered in the fall semester. It is designed for graduate students that either major in Physiology or are interested in integrating physiology concepts into their graduate education. Although there are no prerequisites for the course prior introductory courses in physiology and/or biochemistry are beneficial.

The course will expand upon material in an assigned physiology textbook. Text chapters will be assigned as reading material prior to each meeting. The instructor will review the assigned material during the beginning of each meeting, after which more detailed aspects of the material will be discussed.

The course will have three examinations. The exams will be composed of a mixture of short essays, multiple choice and problem-solving questions. The lectures in PSIO 503 form the first block of the lectures in the more comprehensive PSIO 504 course. Students should enroll in either PSIO 503 or PSIO 504.

PSIO 505 Cellular and Integrative Physiology II (3) This is a physiology course that integrates cellular and organ-based physiology concepts.

PSIO 505 Cellular and Integrative Physiology II (3)
The course, is a one-semester, 3-credit-course that will cover major aspects of physiology not covered in Cellular and Integrative Physiology I. A special emphasis will be placed on how cell function and differentiation are integrated with organ physiology. The course will meet for one-hour sessions, three times per week. The course will be offered in the spring semester. It is designed for graduate students that either major in Physiology or are interested in integrating physiology concepts into their graduate education. PSIO 504 (Cellular and Integrative Physiology I) is a prerequisite for the course. Prior introductory courses in physiology and/or biochemistry are beneficial.

The course will expand upon material in an assigned physiology textbook. Text chapters will be assigned as reading material prior to each meeting. The instructor will review the assigned material during the beginning of each meeting,
after which more detailed aspects of the material will be discussed.

The course will have two examinations. The exams will be composed of a mixture of short essays, and multiple-choice and problem-solving questions.

**PSIO 581** (PHARM 581) Maintaining Homeostasis A: Heart and Vasculature (1) Physiology of the cardiovascular system.

**PSIO (PHARM) 581 Maintaining Homeostasis A: Heart and Vasculature (1)**

This course will cover general principles related to cellular and systemic physiology and pharmacology related to the autonomic nervous system and the cardiovascular system. Materials will be presented through reading and study of textbook materials and the primary scientific literature, reinforced and assisted by lectures and discussions. Concepts of this course are generally organized by organ system designed to address important homeostatic control mechanisms, both neural and humoral, related to the cardiovascular system. Topics to be covered include the physiology of the autonomic nervous system; pharmacology (mechanisms and sites of action; receptors and associated cellular transduction cascades; toxicity; contraindications) of drugs that affect the autonomic nervous system including cholinocceptor-activating and cholinesterase-inhibiting drugs, cholinocceptor-blocking drugs, adrenoceptor agonists and antagonists; synaptic transmission; mechanical properties of skeletal, cardiac and smooth muscle; and the regulation of cardiac function and microcirculation.

General Education: None

**PSIO 583** (PHARM 583) Maintaining Homeostasis C: Kidney (1) Renal physiology and pharmacology.

**PSIO (PHARM) 583 Maintaining Homeostasis C: Kidney (1)**

This course will cover general principles related to cellular and systemic physiology and pharmacology (mechanisms and sites of action; receptors and associated cellular transduction cascades; toxicity; contraindications) of drugs that affect the pulmonary and renal systems. Materials will be presented through reading and study of textbook materials and the primary scientific literature, reinforced and assisted by lectures and discussions. Concepts of this course are generally organized by organ system designed to address important homeostatic control mechanisms related to the lung and kidney. Topics to be covered include the physiology and pharmacology of the pulmonary and renal system; mechanics of breathing, alveolar ventilation, blood flow to the lung, ventilation-perfusion relationships, diffusion and transport of gases, control of breathing, glomerular filtration and renal blood flow, renal transport mechanisms involved in reabsorption and secretion, regulation of effective circulating volume and salt balance, regulation of potassium balance, regulation of acid-base balance during health and disease, principles of pharmacology related to pulmonary and renal systems; principles of gastrointestinal physiology related to drug disposal and action. The course objectives are to assist students in understanding and mastering the basic concepts related to the functions of the lung and kidney, to assure that students obtain a thorough comprehension of basic pharmacological principles, and then to have students apply this knowledge to problems and case studies relevant to pathophysiology and drug action.

PSIO 584 Practical Bioinformatics A: Analysis of Biological Databases (1)
Understanding and using protein, nucleotide, structure and human disease databases.

The proposed course is designed to give graduate students an introductory knowledge on existing biological databases and how such databases can be used in modern research. Topics will include basic navigation through the databases as well as more advanced trainings to uncover novel gene/protein annotations. Literature surveys will be used to familiarize students with the use of database analyses to understand complex biological problems. Topics will include understanding viral gene functions from host counterparts, genes and mutations in human diseases and novel pathways in human.

Plant Pathology (PPATH)

**PPATH 502** Plant Disease Diagnosis (3) Field and laboratory techniques used in diagnosing plant diseases caused by various types of pathogens with emphasis on fungi.

**Plant Disease Diagnosis (3)**

General Education: None
Diversity: None
Bachelor of Arts: None
Effective: Summer 2013
Prerequisite:

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PPATH 505** Fundamentals of Phytopathology (2) An in-depth tutorial of the fundamental theories and concepts of plant pathology.

**PPATH 505 Fundamentals of Phytopathology (2)**

Using the primary literature of the discipline, students will explore, in-depth, the knowledge base of plant pathology. Students will write a 3-5 page paper each week summarizing the major points of the topic covered in the primary literature assigned as related to 4 pathogens/diseases chosen by each student from an approved list. Students will also answer, in writing, 1-2 specific questions posed by the instructor each week. These writings constitute 90% of the grade. 5% of the grade is based upon a written final exam and 5% on oral participation in class.

Bachelor of Arts: None
Effective: Spring 2014

**Note**: Class size, frequency of offering, and evaluation methods will vary by location and instructor. For these details check the specific course syllabus.

**PPATH 522** Professional Development & Ethics in Plant Pathology (1) Graduate students will develop key professional skills and ethics through a combination of lectures, discussions, and assignments.

**PPATH 522 Professional Development & Ethics in Plant Pathology (1)**

This course is designed to help graduate students acquire key professional skill and ethics through a combination of lectures, case study discussions on various ethics and professionalism issues, dialogs with invited guests about their professional experience, and mock exercises of paper and proposal reviews. Topics to be covered include: (a) the process and ethics of publishing, (b) how peer review of papers and grant proposals works, (c) plagiarism, (d) scientific misconduct, (c) oral and poster presentation skill, and (f) successful strategies in grant proposal writing and proposal review.

**PPATH 533** Molecular Genetics of Plant-Pathogen Interactions (3) In depth discussion/review of the primary literature on the mechanisms of plant-pathogen interactions at the molecular and cellular levels.

**PPATH 533 Molecular Genetics of Plant-Pathogen Interactions (3)**

The main objective of this 3-credit course is to help students gain (a) firsthand knowledge of various techniques used in studying the molecular basis of plant-pathogen interactions and (b) knowledge of the current concepts and theories on the nature and mechanisms of the plant-pathogen interactions. In addition, this course will help students develop an ability to integrate and synthesize various areas of knowledge in solving plant health related problems. This course will serve the needs of students in Plant Pathology and other departments/programs who require an in-depth understanding of the molecular basis of plant-pathogen interactions for their program of study. This course will be offered in fall of even numbered years, and its expected enrollment is 8-10. Grading will be based on class participation, paper presentations, assignments, and a mid-term exam.

General Education: None
Diversity: None
PPATH 540 Plant Disease Control (3) Principles of plant disease control, including theoretical considerations involved in control by chemical and nonchemical means.

PPATH 542 Epidemiology of Plant Diseases (3) Disease development in populations of plants, with emphasis on the impact of environment and control practices on rate of development.

PPATH 543 Pathogen Variation and Host Resistance (3) Mechanisms and implications of genetic variation in plant pathogens related to breeding for disease resistance in plants by genetic means.

PPATH 544 Fungal Genetics (4) Fungal breeding systems, mating types, asexual restrictions and recombination, tetrad analysis, gene conversion and extra genetic elements.

Fungal genetics will focus on the classical genetics of fungi starting with the expected inheritance ratios and patterns for single gene and multiple genes on various fungal traits. The methods of establishing crosses and obtaining progeny will be covered in the examples provided. Mating type and breeding systems are an important trait for obtaining the sexual phase, therefore an emphasis will be placed on the genetic determination of breeding methods and mating type, and what is known of mating type switching. There are several unique phenotypes associated only with fungi (pokey, senescent fungi, killer character and others) inherited by mitochondrial DNA and induced by plasmids or transposons. The determination of inheritance and the importance will be examined. Fungi provide the unique opportunity to conduct tetrad analysis in determination of inheritance and mapping of traits. In the laboratory, crosses will be set up by students to obtain data to conduct tetrad analysis and to visualize unusual tetrads brought about by gene conversion. Exchange of genetic material occurs without the sexual cycle though heterokaryosis and the parasexual cycle but may be limited by vegetative incompatibility. These difficult concepts will be discussed as well as visualized by conducting experiments in the laboratory. In discussions, an emphasis will be placed on plant pathogenic fungi and inheritance of virulence which is an important plant pathogen trait. Finally topics on population genetics of fungi including determination of genetic diversity, allele frequencies, genotype frequencies will be studied. Evaluation of student performance will be based on problems sets provided throughout the semester, laboratory reports, student projects and presentations, and a final examination. The problem sets are designed to help students solve genetic problems based on the concepts learned in lecture. The laboratory experiments are designed to complement the lectures and allow students to visualize difficult concepts from lecture. Students will be assigned a plant pathogenic fungus and will explore the literature especially any relevant genetic information on that fungus. The final examination will focus on short answer questions requiring the student to synthesize information. The course will be offered every other spring semester even years. Expected enrollment is 10 students.
Effective: Summer 2013

PPATH 802 (AGBIO 802) Plant Protection: Responding to Introductions of Threatening Pests and Pathogens (3) This course provides knowledge of plant biosecurity, plant disease, regulations, and technologies using case study examples.

PPATH (AGBIO) 802 Plant Protection: Responding to Introductions of Threatening Pests and Pathogens (3)

This course covers agricultural biosecurity relevant to plant based agriculture. Topics include the size and scope of plant agriculture domestically and globally, the concept of plant disease, threats to plant health, transmission of pests and pathogens and the role of government. Information on the regulatory component of plant protection will be included. Case studies of introductions of threatening pests and pathogens will be reviewed in depth and comprise the majority of the course. These cases are selected to represent different means of introduction and different types of pests of pathogens. Detection and tracking, sampling, response approaches, technologies, communication and outcomes will be considered and compared. Finally, an assessment of readiness for future introductions will be synthesized and presented.

PPATH 853 (TURF 853) Interpreting Turfgrass Science Literature (3) Introduction to turfgrass research publications, interpretation of the data, and discussion of the significance of the results.

PPATH (TURF) 853 Interpreting Turfgrass Science Literature (3)

This course will provide an introduction to literature search in turfgrass management, identification of most pertinent peer-reviewed journals for each area of interest/specialty in turfgrass management, and utilization of other resources such as technical journals, trade journals, online and resident educational material resources, extension bulletins/circulars from various institutions/organizations that addresses various topics on turfgrass management. This course will prepare the students for analyzing research questions or rationale formulated by an investigator, for understanding how the study was devised to address the objectives adequately and the results were obtained and presented in the publication, and for identifying the take-home message in the publication. Emphasis will be made on the criteria used for data collection, the significance of methods employed in statistical analyses of the data, and presentation of results in the publications to effectively convey the information to readers.

PL SC 409 (CAS 409) Democratic Deliberation (3) Explores the theory and practice of democratic deliberation in elections, town meetings, juries, legislatures, and other public institutions.

Democratic Deliberation (3)

Many modern democracies have made strides to become more deliberative in how they make decisions. This course looks closely at the most promising innovations in self-government while also reviewing the persistent anti-deliberative and undemocratic features of modern societies and governments. Topics covered in the course include deliberative democratic theory, political conversation, common forms of public meetings, mediated deliberation, campaigns and elections, the jury system, and deliberative democracy on larger social scales.

PL SC 410 Strategy and Politics (3) This course examines political behavior using social choice theory and game theory.

Strategy and Politics (3)

Strategic behavior is central to politics. It is common for political outcomes to be determined by the interaction of individuals seeking goals in an environment in which goal attainment is complicated by the choices of other actors. This course introduces various methods for analyzing strategic behavior using social choice and game theories. We will employ these approaches to better understand a wide range of political phenomena in international politics, comparative politics, and American politics, such as war, terrorism, voting, electoral competition, government formation, and democratic transitions. By the end of the course, students will, among other things, have experience using games to analyze a range of political behaviors and institutions. The course assumes no prior knowledge of social choice theory or game theory.

PL SC 411W Principles of International Cooperation (3)

This course explores the forces and conditions that make conflict, or cooperation, more likely in international relations. Since international anarchy prevents actors from trusting one another cooperation should be rare or nonexistent. In spite of the logic and prevalence of such arguments, international cooperation does exist. While there is no definitive explanation for the persistence of cooperation in a world without central authority, we will pursue several arguments about how and why it does emerge. These arguments are based upon characteristics of the international system along with concepts developed principally from game theoretic approaches to the study of politics. By the end of the course students should have a basic grasp of game theory in international relations as well as examples of cooperation and conflict around the world. The game theoretic approach will enable students to understand why countries with often common interests and good intentions nevertheless fail to cooperate. Students will be expected to write essays that demonstrate their mastery of these theoretical constructs and ability to apply them to real world situations about which they have done independent research.

Political Science 411W fulfills the related course requirements for the revised International Politics Major and International Relations and 400 level course requirement for the Political Science major.

PL SC 412 International Political Economy (3)

This course is an introduction to the scientific study of international political economy (IPE), an interdisciplinary field related to international politics and international economics. Some exemplary issues IPE addresses include the collective action problem among nation states, the management and openness of international economy, the determinants of foreign economic policies, and the causes and consequences of economic globalization. IPE examines the interaction between politics and economics at the international level as well as between the international and domestic levels, involving various political and economic actors (governments, MNSs, interest groups, as well as individuals). The course aims to develop the analytical skills of students in explaining theoretically international political and economic events.

PL SC 414 Dictators and Their Demise (3)

Dictators and Their Demise (3)

Dictators and Their Demise provides a broad exploration about how non-democratic governments throughout the world rule. We examine: the conditions that give rise to authoritarianism; the variety of authoritarian regimes; the strategies authoritarian leaders use to stay in power; the consequences of different types of authoritarianism for outcomes such as economic growth and human development; and the domestic and international sources of authoritarian demise. The course covers cases of authoritarian rule in: Chile, the Dominican Republic, Egypt, Malaysia, Mexico, and the former Zaire (now the Democratic Republic of the Congo or DRC).
The course builds knowledge about the governments under which most people in the Global South lived during the 20th century. Even today, roughly half of the world’s population lives under some form of non-democratic government. Yet almost all courses currently in the curriculum, particularly in the field of comparative politics, focus exclusively on democratic forms of government. This course therefore examines a new topic not currently offered in the curriculum.

In additional to learning about different types of authoritarian rule, students form an understanding of how common foreign policy tools, such as economic sanctions, foreign aid, and human rights shaming, are likely to affect domestic politics in these countries. This knowledge helps students critically evaluate foreign policy relationships between democracies, such and the United States, and dictatorships.

Course materials cover theoretical approaches to the study of authoritarian rule, in-depth case studies (including novels, biographies, and documentary), and empirical research. This course requires student presentations, weekly reading assignments, descriptive analysis of quantitative data in graphs, multiple written assignments, and a final take-home essay exam. Students develop analytic skills through the weekly written homework assignments in which they apply the broad theoretical concepts to analyze counter factual situations from specific cases of authoritarian rule. Oral presentations develop inter-personal skills and require students to research specific cases of authoritarian rule currently in the news. This helps students critically evaluate current events.

Finally, the written assignments require students to develop skills working with real data. Students collect and graphically present basic descriptive data about economic and human development in non-democratic countries: economic data, infant mortality, literacy, and indicators of women’s well-being. Using real world data to make international comparisons helps students develop skills to form and articulate complex arguments, and teaches them the basics of research design.

**PL SC (WMNST) 428 Gender and Politics (3)**

(US;IL) This course meets the Bachelor of Arts degree requirements.

This course is designed as an overview to the field of women and politics. It examines the role that women play in politics in the United States and around the world. Students will begin by examining how women are socialized differently from men and how that socialization affects women's political attitudes and participation. Then students will focus on women in different political offices and how their behavior compares to that of their male counterparts. Students will then analyze the women's movement in the United States. Finally, students will turn to different theories of the ideal position of women and men in politics and use those theories to explore the issue of pornography. Students will be evaluated on a final exam, short essays (4 3-5 page essays), class participation, and a research paper (15 pages). This is an advanced course with 6 credits prerequisite in Women's Studies or Political Science. This course fulfills the American Politics and Comparative Politics distribution as well as the advanced course requirement for the Political Science major. It is an elective for a Women's Studies major. It also fulfills an International/Intercultural competency requirement. This course will be offered once a year with 35 seats per offering.

PL SC 430W Selected Works in the History of Political Theory (3) Detailed examination and analysis of a selected major work, thinker, or tradition in the history of political theory.

PL SC 430W Selected Works in the History of Political Theory (3)

The course will examine the tradition of "liberal" political philosophy, focusing principally on the social contract tradition in Western political philosophy. We will examine the work of the "classic" social contract theorists - Hobbes, Locke, Rousseau, and Kant - and discuss some more recent variants. We will then consider broad contemporary critiques of this tradition. In particular, we will consider charges of exclusion, parochialism, and biased conceptions of the self allegedly manifested in liberal theories, especially as those charges that center on considerations of race and gender.

PL SC 433 Political Foundations of the Early American Republic (3) The course introduces students to the major political and philosophical movements that influenced the founders of the early American republic.

PL SC 433 Political Foundations of the Early American Republic (3)

The course introduces students to the major political and philosophical movements that influenced the founders of the early American republic. The first section of the course, set in the ancient world, will examine the earliest experiments in democratic government in both Greece and the Roman Republic. In addition to studying the structure and traditions of ancient governments, students will consider competing theories for why these early democratic experiments ultimately failed. The second section of the course traces the gradual evolution of representative democracy in Britain from the signing of Magna Carta to the quiet subjugation of the monarchy in the 19th Century. Recognizing that the theoretical structures of political power remain somewhat fixed in this period, students will consider how legal precedent can gradually transform seemingly static political institutions. The third section of the course examines American efforts to establish stable representative institutions in the aftermath of the Revolutionary War. Looking back at both ancient and
modern constitutional traditions, students will examine how prior democratic experiments heavily influenced the deliberations of the founders both at the Constitutional Convention and in the establishment of the new federal republic.

PL SC 434 (IL) (AFR 434) War and Development in Africa (3) This course will examine the relationship between war and development in sub-Saharan Africa in the post colonial era.

This course will examine the relationship between development and war in sub-Saharan Africa in the modern era. Specifically, it will analyze the extent to which the processes of state building, nation building, and international intervention have contributed to the incidence of both civil war and international conflict in Africa. We will begin with a review of several theoretical arguments on the causes of warfare in Africa and then turn to a discussion of theses on African political development. This course complements present offerings in international relations and comparative politics in the PL SC department and can serve as an advanced undergraduate offering in the African Studies concentration in AAAS. The course directly complements our present offerings in international conflict given that we don’t have a regularly offered course that focuses on conflict in a specific region. In addition, it will augment our comparative politics offerings with an examination of prominent issues in comparative politics such as political development, democracy, and modernization. The course will fulfill the IL requirement and encourage students understanding of the historical background as well as the political, economic, and cultural factors that influence African politics. African conflicts are often viewed as “ethnic conflicts” and in this class students have an opportunity to assess the extent to which ethnic, linguistic, or religious factors influence the likelihood of conflict and contribute to development in African states. Students will also be required to write essays evaluating the contribution of a range of theoretical arguments on Africa’s conflicts in order to assess the degree to which cultural more than political or economic factors contribute to their onset. Students will then have the opportunity to conduct more extensive research on a specific African case to develop their analyses further. These exercises will often require that students reevaluate their beliefs about social identities such as race (e.g. in Rwanda the difference between Tutsi and Hutu is often viewed as a “racial” difference between black Africans, which is at odds with most Western conceptions of race). They also require students to challenge stereotypes regarding the subordination of African values in conflicts to a simple concern with “tribe”. Students will gain a broader knowledge and appreciation of the different values, traditions, and cultures evident in Africa and understand how these can both exacerbate and mitigate conflict. Evaluation in the course will consist largely of examination of the students’ brief expository essays and larger case studies for which students will be encouraged to conduct original research. The course should be offered biannually with a class limit of about 40 students.

PL SC 435 Foundations of American Political Theory (3) Political theories of colonial, revolutionary, and constitutional periods presented through works of selected thinkers and analysis of particular political problems.

Foundations of American Political Theory (3)

PL SC 435W Foundations of American Political Theory (3) Political theories of the revolutionary and constitutional periods presented through works of selected political thinkers and political issues.

Foundations of American Political Theory (3)
PL SC 436 Civil Wars (3) This course examines factors influencing the onset, duration, severity, termination, recurrence, and consequences of civil wars around the world.

PL SC 436 Civil Wars (3)

This course provides a broad exploration of the causes, characteristics, and consequences of civil wars. In particular, it investigates what makes civil wars more likely to occur, what influences how long they last, how severe they are, and how likely they are to recur, while also considering their consequences for the states that experience them. It considers the scholarly research on this topic over the past decade or more, and builds an awareness both for what are the known regularities as well as what are the continuing uncertainties about the place of civil war in the contemporary international system. It does this specifically within the context of scientific research about civil wars, and thus also advances student knowledge about how social scientists learn what they know about how the world works. Building on this perspective, and after absorbing the lessons to be learned from the literature, students will gain even greater appreciation for the quality of knowledge about civil wars by conducting their own detailed analysis of a civil war (each student will study one civil war of their choosing) asking how well the civil war they study fits patterns identified by the literature. This course complements, without duplicating, existing political science courses about militarized political conflict, and qualifies as one course majors can take to satisfy their 400-level course hours requirement. In addition to political science majors, it should be of interest to international politics majors, students in other social science majors, and perhaps Masters students in the School of International Affairs as well.

PL SC 440 (US;IL) (AFR 440, I B 440) Globalization and Its Implications (3) This course explores the socioeconomic implications of globalization.

PL SC (AAA S/I B) 440 Globalization and Its Implications (3) (US;IL)
This course explores the socioeconomic implications of globalization and some fundamental changes that have taken place in the global socioeconomic system. The bipolar configuration of global power has been radically altered, market-state relations have been reformulated, and global systems of production and finance have been reorganized. Given these recent changes in the world’s structure, globalization as a socioeconomic force is examined with a special emphasis on its implications on social issues, capital-labor relations, the roles of unions and transnationals, unemployment issues, poverty and inequality, gender and ethnicity issues, race relations, and democratization around the world. This course also allows students to explore how different countries, communities, social classes, business firms and even institutions are affected differently by globalization. The implications of globalization on Africana communities is given special attention.

The course is organized into three parts: A) The first part of the course attempts to define globalization and identify its essential characteristics in light of social and economic change. This part attempts to answer questions such as what constitutes globalization, how do we know if globalization is taking place, and what aspects of it are new. B) The second part of the course attempts to assess the implications of the different aspects of globalization (identified in the first part) on many critical social issues, including capital-labor relations, the roles of unions and transnational corporations, problems of unemployment, poverty and inequality, gender, ethnic, and race relations, and democratization. C) The third part of the course examines the implications of globalization to African communities.

This course exposes students to the economic, social, political, and cultural implications of the unfolding global order. It allows them to explore how different countries, communities, social classes, business firms and even institutions are affected differently by globalization. Evaluation will be based on daily attendance, along with a class presentation of a design of a research paper; an actual research paper, a mid-term exam and a final exam.

PL SC 443 (IL) (AFR 443) Ethnic Conflict in Africa (3) This course explores the various causes and impacts of ethnic conflicts in the African context.

PL SC (AAA S) 443 Ethnic Conflict in Africa (3) (IL)

(BA) This course meets the Bachelor of Arts degree requirements.

Ethnic conflict is presently a pervasive worldwide phenomenon. Ethnic groups in various regions of the world contest the terms of their incorporation into the ‘nation’ state and the world order. Such contests have often erupted into violent conflicts crossing national borders. The objectives of this course are to examine the problems of state building, the evolving nature of the state, and ethnic conflicts in the African context. The course explores the factors that contribute to violent ethnic conflicts and the factors that mitigate such conflicts. The course largely evolves around the following two general questions. What are the most important internal and external factors that cause ethnic conflicts? The second is what political systems and arrangements tend to mitigate or resolve ethnic conflicts? In an effort to deal with these two general questions the course examines a number of case studies from different parts of Africa. The course is organized
into three parts. The first part surveys general theories on the causes of ethnic conflicts and how democracy relates to ethnic conflict. The second part examines several case studies from Africa and attempt to construct a general hypothesis on the major causes of ethnic conflicts and how democratization or lack of it impacts the conflicts. The third part examines measures that may contribute in the resolution of ethnic conflicts and enhance the process of state building in Africa. Students in groups of two or three will choose a case and give a class presentation on the most important issues involved in a given conflict.

This course compliments other courses that deal with African politics, politics of developing areas, and social movements. It also supplements courses in African and African American Studies, Sociology, and Political Science that deal with issues of ethnic and race relations, as well as issues of nation building (state building).

This course exposes students to the various internal and external factors that precipitate ethnic conflicts in Africa and the economic, social, and political implications of these conflicts. It allows students to explore how different states attempt to address the problem. Evaluation will be based on attendance (5%), a class presentation of a design of a research paper (10%), a research paper (35%), a mid-term exam (25%) and a final exam (25%). This course will be offered once a year.

PL SC 445Y (US) (AF AM 445Y, LER 445Y) Politics of Affirmative Action (3) Examines history, politics, and economics of the use of special programs to advance racial interests in the U.S.

PL SC (AAA S /LER) 445Y Politics of Affirmative Action (3) (US)

(BA) This course meets the Bachelor of Arts degree requirements.

The objectives of this course are to introduce students to the relationship between affirmative action and other policies purportedly designed to end racial inequality in the U.S. This course approaches the study of affirmative action in the context of the historic racial discrimination and inequality that Black Americans have faced since the founding of the Nation. The purpose of this course is to help students think about how contemporary and historic affirmative action policies relate to race, concepts racial inequality, the historic and continuing causes for racial inequality, public opinion, American politics and economic thought. The course materials will lead students through scholarly and popular articles, books and video presentations on the topic. It is hoped that students will become familiar with the history of affirmative action from its conception. Students will gain an intimate understanding of affirmative action economic and social outcomes on various racial groups. No prior knowledge is assumed, however a knowledge of civil rights history, quantitative methods, and constitutional law will be useful. The Politics of Affirmative Action satisfies the requirements for major and minor electives for the African American Studies, and major and minor electives for Political Science, and Labor Studies and Industrial Relations. Students are evaluated on the basis of an examination, term paper, class participation and class presentations of papers.

PL SC 450H (J ST 450H) Genocide and Tyranny (3) This course focuses on the conceptualization and socio-political determinants of genocide and tyrannical regimes, with an emphasis on the Holocaust.

PL SC (J ST) 450H Genocide and Tyranny (3)

This course focuses on the etiology of mass killing, with an emphasis on the socio-political determinants and consequences of massacres, ethnic cleansing, and other crimes against humanity. It is designed to help students
understand genocide as a phenomenon of political violence and to explore the epistemological issues associated with the study of genocide. Students will learn to use the study of specific events (such as the Holocaust) to understand broader concepts and phenomena (in this case: genocide) as well as to develop analytical and communication skills through active discussion in class sessions.

The course is divided roughly into three parts: The objective of the introductory part of the course is to situate genocide as an act of political violence, and to create a working definition of the concept for the topics covered in subsequent weeks. In the second part various aspects of the Holocaust will be examined. Starting with a history of the Holocaust, we will cover philosophical, political, and military explanations for it. Some of the questions we will discuss in this part of the course include: (a) How does the Holocaust fit into the typologies of genocide? (b) Can extreme genocide that can be studied in a comparative context with the Holocaust? Does the “uniqueness” of the Holocaust influence the manner in which we study it? (c) Were the determinants of the Holocaust rooted in larger social and political factors? (d) Which contemporary political factors were associated with the Holocaust? During the last part of the course, we will discuss three other instances of genocidal violence: Armenia, Yugoslavia, and Rwanda. These events will be discussed using the same theoretical and analytical approaches as in the previous weeks. The concluding sessions will also focus on the questions of why it is important to study genocide, what lessons can be learned from understanding such events, and whether studying genocide is relevant to the current international system. Course topics will be discussed in light of assigned readings and films.

This course fulfills the distribution requirement for international relations, as well as the advanced and related course requirements for Political Science majors. The course fulfills the supporting course requirement for International Politics and Jewish Studies majors.

(II)

(BA) This course meets the Bachelor of Arts degree requirements.

In this course, we will discuss the current democratization trend in Africa by focusing on the experiences of African countries.

The course is divided into three sections. Part One considers a range of factors that affect politics in Africa. We will discuss in depth the following factors: colonialism, nationalism, the relationship between state and society, ruler-ship, the military, political parties, and economic development. Then, we will consider the experiences of our four cases, to gain a historical background. In part two, we will focus on democratic transitions. We will discuss the factors that enable transitions to occur, as well as the process that transitions follow. Then, we will consider four transitions: two that resulted in the installation of a democratic government (Nigeria in 1979, Sudan in 1986) and two that ended in continued authoritarianism (Angola in 1992, Kenya in 1978). Part three considers the prospects of democracy. We will discuss the probability of a democratic transition occurring in the near future.

The goals of this class are four fold. First, students will gain detailed knowledge about four African countries. Second, we will learn how to compare countries. Third, students will have a better understanding of the democratization process in general, and will be able to explain or predict democratization beyond the four cases discussed in this class. Finally, the experiences of these four countries offer a deeper understanding of what democracy is and provide students with greater flexibility to fulfill requirements in either the African and African American Studies major or the Political Science/International Politics major. PL SC 454 will be offered once per year with 35-50 seats per offering.

PL SC (AAA S) 459 Culture and World Politics (3)
This course examines the role of culture in world politics through an analysis of the varying dimensions of culture and their respective impact on the likelihood of cooperation and conflict among the state and non-state actors in the global system. Specifically, we examine the impact of culture in terms of social boundaries, political associations and the likelihood of an emergent global culture defined largely in terms of customs and practices related to international trade and economic production. We also examine the role of culture as a mechanism for the dissemination and maintenance of patterns of hierarchy. Integrating these different conceptions of culture, we examine the relationship between culture and foreign policy in the US.

PL SC 464 (IL) (AFR 464) Globalization, Extractive Industries, and Conflict in Africa (3) Socioeconomic and environmental impacts of extractive industries in Africa.

PL SC (AAA S) 464 Globalization, Extractive Industries, and Conflicts in Africa (3) (IL)
Globalization has brought increased investments in extractive industries in many African countries. Investments in extractive industries are also likely to continue to increase rather rapidly, given the rising intensity in the competition for African resources, brought about by growing involvement of countries, such as China and India. The terms African countries obtain from corporations for mineral rights have been generally unfavorable. The unfolding competition for African resources brought about by investments from China and India may, however, help African governments to renegotiate the terms of mining concessions corporations to obtain better deals for their resources. Despite the rather poor terms African governments currently have, investments in extractive industries have stimulated economic growth in several countries. Some African countries, including Equatorial Guinea, Botswana, Gabon, Angola, Cameroon, and the Sudan, are experiencing what might be regarded as resource-based economic boom.

Such growth has, however, intensified compulsory acquisition of communal lands by African governments for concessions to extractive industries exposing large numbers of rural communities to evictions form the land they traditionally owned. The expropriations, which purportedly take place for public and development purposes, have led to serious socioeconomic problems, including unemployment and poverty of those evicted from their land, disintegration of traditional institutions of governance, civil wars, communal conflicts, human rights violations, high levels of corruption, and alarming rates of environmental degradation. The conflicts have ravaged many African counties and are likely to continue to occur until mechanisms that allow rural communities to become partners of the transformation are developed. This course examines the socioeconomic and environmental problems associated with land expropriations and extractive industries.

PL SC 466 Political Psychology (3) An interdisciplinary investigation of the major topics and debates characterizing the subfield of political psychology.
PL SC 466 Political Psychology (3)

This course offers an interdisciplinary investigation of the major topics and debates characterizing the subfield of political psychology. It draws on research being done in a variety of disciplines and disciplinary subfields including social, developmental and clinical psychology; the cognitive neurosciences; biological anthropology; genetics; evolution; and behavioral economics to examine political behavior. Specifically, the course will examine the thinking and actions of both political elites and the mass public, and consider the reasoning processes they employ in order to make sense of the political world. Topics to be covered include how emotions (e.g., fear, lust) shape human reasoning; how preferences develop; how differences in cognition, emotion and personality inform political judgment and shape political leadership; how prejudices develop and affect war and other conflicts; how political and social identities develop and how they affect individuals' political judgments and decisions; how neurobiological influences operate in conjunction with social and cultural factors to affect how individuals process information; and how genetics and hormones affect individuals political development and behavior. Through these and other topics covered in the course, students will develop an understanding of how political elites and ordinary citizens process information, develop preferences and make decisions, and why, as a consequence, they act as they do.

This course fulfills the distribution requirement for American politics and comparative politics, as well as the advanced and related course requirements for Political Science majors. The course also fulfills the supporting course requirement for International Politics majors.

PL SC (ASIA) 469 Government and Politics of South Asia (3) (IL)

This course provides an overview of the politics of modern South Asia with particular attention to the experiences of Afghanistan, India and Pakistan. It examines theories of political and economic development and ethnic politics, the impact of the British colonial experience on South Asia, the rise of nationalism, and the emergence of independent nation states in the region. Three important themes are explored throughout the course: (1) the state of economic development in the three countries; (2) the relationship between identity politics and violence; and (3) the international relations of these countries, with particular attention to terrorism and nuclear policy. Course topics will be explored through readings from textbooks and assigned articles, articles from current news sources and, documentary films from the three countries. By the end of the course, students will have knowledge of the politics of Afghanistan, India and Pakistan and the political factors that have shaped their development over the past century. Students will acquire the tools necessary to evaluate critically the impact of war, the legacy of colonialism, and the challenge in building durable democratic institutions. This course fulfills the distribution requirement for comparative politics, as well as the advanced and related course requirements for Political Science majors. The course also fulfills the supporting course requirement for International Politics majors and the related areas requirement for Asian Studies majors.

PL SC 481 Global Political Economy (3)
Changes in the international system in the 1970s led to increased interest on the part of students of international relations in the political economic processes underlying change. Important debates among scholars in both mainstream theoretical traditions and in critical theory gave rise to International Political Economy as an increasingly visible sub-field in International Relations. This seminar tracks the historical relations between the development of capitalism as an economic system and the emergence and transformation of global politics, using concepts developed in the study of political economy. Seminar discussion, examinations, and a short research paper will be used to evaluate students' learning.

PL SC 486 (ASIA 489/HIST 489) International Culture in East Asia (3)

(IA)

(BA) This course meets the Bachelor of Arts degree requirements.

This course will examine the place of culture in international history through a comparative look at the role of cultural circulation and exchange in relations among China, Korea, and Japan (and between East Asia and the West) from the propagation of Buddhism in the first century A.D. to present-day circulation of popular music, movies, and comics. We will explore the international politics of culture and the politics of international culture, considering questions of what constitutes culture, whether it is ever entirely separate from politics, and how that separation has evolved over time. These larger themes of the course will be tackled by following the historical movement of concrete objects and people throughout the region. This is a course in international history; historical events, problems, and issues will be at the center of our weekly discussions. But it also seeks to explore aspects of international relations.

This course is intended to examine the role of cultural exchange in international relations. The goals of the class are not only to gain an understanding of the uses and impact of culture in international relations, but also to develop the skill of building such an understanding through primary and secondary sources, both written and visual. Students in this class will take on the role of historian themselves, thinking critically about assigned texts and making their own interpretations of their meanings. Through readings, discussions, presentations, and the final project, students will enhance their ability to think critically and to express their ideas clearly in both speech and writing.

Class work includes some lecture but emphasizes guided discussions, group work, writing exercises, and some student presentations. This participatory approach is intended to deepen student’s appreciation of the assigned readings, to help them understand value systems that may differ from those predominant in western cultures, and to assist students in developing both analytic and expressive abilities. Evaluation will emphasize student performance on a day-to-day basis and as expressed in a final research project. A possible break down would be as follows:

This course is designed to respond to strong student interest in East Asian international history. This course will complement and extend popular survey and upper-level courses such as HIST.
PL SC 487 International Law and Organizations (3) Major topics and issues of international law with special attention to institutional arrangements (international organizations) through which that law operates.

PL SC 487 International Law and Organizations (3)
The course is useful in two distinct ways. First, it aids in the understanding of how countries conduct their relations with one another. Second, studying international law-it is a distinct system of law-- helps students to assess whether they might be suited for law school.

The course introduces international law and international governmental organizations (the two are closely linked) and their role in the management of peaceful relations among countries as well as during international conflict. Both the contributions and limitations of international law will be analyzed. International law is viewed both as a body of norms countries feel an obligation to follow and as a means of communication among countries.

Major topics covered include sources of international law, human rights law, environmental law, economic law, law of the sea, and the use of force. There are several hundred major intergovernmental organizations. Several of the most prominent will be discussed including the UN, the WTO, the European Union, the International Labor Organization, and the International Court of Justice.

Examinations are principally of the essay variety although a command of factual information is essential to success in the course. Students also prepare critiques of important international legal cases (many of which have been decided by national courts) and of treaties (the principal modern manifestation of international law).

PL SC 488 Comparative Public Policy (3) Comparative methodology and public policy implementation in postindustrial societies; selected case studies of policy output.

PL SC 488 Comparative Public Policy (3)
Comparative Public Policy is an upper level political science course that includes components of comparative politics, public administration, and descriptive economics. The course presumes that developed industrial democracies confront common challenges in meeting human needs and that policy comparison is worthwhile despite distinctive societies and political cultures. For example, government involvement in the provision of health care varies widely from Britain’s National Health Service to the largely private approach of the United States. Nevertheless all health care systems confront rising technology costs, an ageing population, and rising performance expectations. A primary purpose of the course is to consider the origin and development of individual country programs while assessing the common challenges. Cross national comparison becomes relevant to the course by including some available data on costs, implementation and outcomes. Because the course includes about six distinct areas, e.g., education, taxation, urban planning income support, and overall macroeconomic policy, the course will depict profiles of policymaking in Europe, North America and Japan. Ideally comparison should help students to evaluate the effectiveness of policy choices of a particular country and government.

A second objective of the course will be to examine the national approaches to the relationship between the state and private economic activity. Not only does government expenditure amount to nearly half of some country’s total output, government choices create distinctive legal environments for business activity. Anti-trust, health, wage, and consumer regulation offer an excellent point of comparing different incentives for economic activity in the United States and Europe. Apart from policy choices mentioned in the first paragraph, the regulation of economic activity has cumulative results for employment and the distribution of income. This portion of the course is intended to be somewhat more elementary than the first because of the probability that students will be less familiar with its content. The primary objective will be to help students understand the variations among market economies and reasons for their description as “neo-liberal,” “social market,” or “corporatist.”

Finally, the course will examine some current ideas about recent changes in the global economy and their consequences for national policy. Clearly “globalization” has become a matter of political concern owing to its consequences for the creation of wealth, employment, growth and distribution. While the course cannot devote detailed or exclusive to the European Union, Europe’s response to rapid movements in short term capital and investment presents an interesting point of comparison with the United States and Japan. The course should enable students to understand the meaning and
criticism of “globalization” as a factor in shaping some national policies.

PL SC 489 Public Administration (3) A survey of the major approaches to the management of most governmental agencies.

PL SC 489 Public Administration (3)

Government Management is a three-credit Political Science course that teaches the role and function of bureaucracy. Although some investigation is made about state and local government functions, the primary focus of the course is on the federal bureaucracy. In particular, the course illustrates how the interrelationship between the three branches of government exists using the various federal agencies as functionaries.

The course first examines the basic functions of bureaucratic agencies in the modern world; primarily their distributive, re-distributive and regulatory activities. In addition to these functions, the various external and internal political forces that form the mission of the agencies are examined. Next the internal function of a bureaucracy is examined by highlighting the various roles of the people who comprise a typical large agency. The roles of the political appointee, the career professional, the general civil servant and the union laborer are examined, with the GS system of the federal government used as a guide to show the hierarchy that exists in a large agency.

By highlighting both the functions of a typical agency and examining its role in the larger government structure, and by looking inside the bureaucracy to see the various short and long term roles of the people who comprise those agencies, the student appreciates how large bureaucracies are at the same time always changing, and always staying the same.
