This course explores a variety of theories and methods in bioethics and applies them to a selection of current topics.

This course explores systemic and structural issues in bioethics, and the theories and methodologies required to address them.

This course will examine the complex ways ethical issues are a component of research in science and engineering. BIOET 504 Research Integrity in Science and Engineering provides a foundation for understanding an expanded conception of research ethics that includes traditional responsible conduct of research (RCR) issues, but encompasses two additional domains in which ethical issues are relevant to the conduct of science, namely, the broader impacts of science and ethical issues that are embedded in scientific practice. Students in this course will develop a robust understanding of ethical responsibility and ethics spotting in their professional work as well as pedagogical training to support their becoming research integrity leaders in their home disciplines. In this course, students will: understand and identify instances of embedded ethics, broader impacts, and research integrity as they apply to work within their profession; develop the ability to apply ethical reasoning skills to examples of each domain of research ethics through case-based analyses; and acquire pedagogical skills in research ethics through developing, delivering, and assessing curricular materials on relevant research ethics topics drawn from their home disciplines. Students will also develop a research ethics teaching portfolio and will be encouraged to work with their departments to identify ways to develop peer mentoring on these important topics.

This course will provide students with an understanding of the ethical dimensions of renewable energy and sustainability systems and with skills to analyze related case studies. Case studies that will be considered are grounded in topics relevant to the sourcing and generation of energy across political-economic development contexts, including the use of sustainability indicators. Energy related topics include everything from traditional fossil fuels to renewables such as wind, solar, and biofuels. Students study responsible conduct of research (RCR) and professional ethics, in the commercial and academic context of applications in the area of renewable energy and sustainability systems, as well as examine the ethical dimensions of broader public and environmental impacts, and embedded values in research and analysis in this field. The course will provide for ethical analyses of knowledge generation and communication issues such as: selection of research questions; selection of datasets and parameters; determination of system boundaries; procedural considerations in decision making processes; methods of analysis; risk assessments and communication; influence of scientific research on policy outcomes; and, how to critically evaluate the use of scientific evidence and expertise when making and communicating arguments. Some lessons/modules will focus more on ethical issues encountered in practice, while other modules will provide examples that will impact overall ethical literacy and awareness of social and ethical impacts relevant to renewable energy and sustainability systems research and its numerous applications.

This course will examine in a bioethical context a variety of ways relations of power and values intersect. Bioethics, Biopower, and Biopolitics will develop an understanding of bioethics by considering the ways people's lives interconnect and the relations of power that infuse and often control these interconnections. The goal is to expand the use of the term "bioethics" beyond the scope of medical practice and institutions and to bring it to bear on a much wider scope of life. We will consider options for understanding the meaning of "bioethics" by reference to the interplay of values and relations of power that more or less enhance human lives by the practices and policies that form, control, or liberate them.

Continuing seminars in bioethics that consist of a series of individual presentations by faculty, students, or outside speakers.

Supervised student activities on research projects identified on an individual or small-group basis.

Supervised off-campus, nongroup instruction, including field experiences, practicums, or internships related to bioethics.

Creative projects, including nonthesis research, that are supervised on an individual basis and which fall outside the scope of formal courses.

Formal courses given infrequently to explore a topic or topics in bioethics in depth.
BIOET 602: Supervised Experience in College Teaching

1-3 Credits/Maximum of 6

Students will teach lower-level undergraduate courses in bioethics, including courses on the undergraduate minor in bioethics and medical humanities.
