ENERGY AND MINERAL ENGINEERING (EME)

EME 301: Thermodynamics in Energy and Mineral Engineering
3 Credits
Treatment of classical thermodynamics targeted to the needs of students in the Department of Energy and Mineral Engineering.
Prerequisite: CHEM 112 and PHYS 212; MATH 250 or MATH 251

EME 303: Fluid Mechanics in Energy and Mineral Engineering
3 Credits
Treatment of fluid mechanics targeted to the needs of students in the Department of EME.
Prerequisite: MATH 250 or MATH 251 and PHYS 211

EME 407: Electrochemical Energy Storage
3 Credits
Electrochemical concepts in energy storage devices, cell construction and materials involved in batteries and capacitors, electrochemical testing methods and applications.
Prerequisite: EME 301 or M E 300 or CH E 220 and EME 303 or M E 320 or CH E 330 or their equivalent

EME 432: Energy Policy
3 Credits
Analysis, formulation, implementation, and impacts of energy-related policies, regulations, and initiatives.
Prerequisite: E B F200, EGEE 120, PL SC490
Cross-listed with: GEOG 432

EME 444: Global Energy Enterprise
3 Credits
Global Energy Enterprise provides in-depth insight into the role that public and private nonmarket actors and actions play in contemporary energy markets through a variety of artifacts and case studies. Students perform a nonmarket analysis of a current energy policy case study through series of guided steps using a well-regarded analytical framework. The course also provides an overview of technical, environmental, economic, and sociopolitical aspects of modern energy sources, as well as an overview of international energy and policy regimes.
Prerequisites: ECON 104 and EGEE 120 and EGEE 120

EME 460: Geo-resource Evaluation and Investment Analysis
3 Credits
The course covers engineering evaluation of geo-resources, present value and rate of return analysis, mineral property and reserve estimation, and cost estimation and engineering economy concepts applied to geo-resources including energy and minerals.

EME 466: Energy and Sustainability in Society
3 Credits
EME 466 provides the culminating experience for Energy and Sustainability Policy majors through an individualized inquiry-based capstone project in which students tackle the wicked problems of sustainability they see and experience in their own communities. Students identify, organize, execute, and reflect on a local issue related to energy, the environment, or sustainability with particular emphasis on policy-based solutions.
Prerequisites: GEOG 30N, CAS 100, GEOG 432
